Paths
Notify about PM related events

**POST**
/URI_is_provided_by_the_client_when_creating_the_subscription_PerformanceInformationAvailableNotification

**Description**

The POST method delivers a notification regarding a performance management event from the API producer to an API consumer. The API consumer shall have previously created an "Individual PM job resource" or "Individual threshold resource". This method shall follow the provisions specified in the Tables 7.4.9.3.1-1 and 7.4.9.3.1-2 for URI query parameters, request and response data structures, and response codes.

**Parameters**

<table>
<thead>
<tr>
<th>Type</th>
<th>Name</th>
<th>Description</th>
<th>Schema</th>
</tr>
</thead>
<tbody>
<tr>
<td>Header</td>
<td>Accept <strong>required</strong></td>
<td>Content-Types that are acceptable for the response. Reference: IETF RFC 7231</td>
<td>string</td>
</tr>
<tr>
<td>Header</td>
<td>Authorization <strong>optional</strong></td>
<td>The authorization token for the request. Reference: IETF RFC 7235</td>
<td>string</td>
</tr>
<tr>
<td>Header</td>
<td>Content-Type <strong>required</strong></td>
<td>The MIME type of the body of the request. Reference: IETF RFC 7231</td>
<td>string</td>
</tr>
<tr>
<td>Header</td>
<td>Version <strong>required</strong></td>
<td>Version of the API requested to use when responding to this request.</td>
<td>string</td>
</tr>
<tr>
<td>Body</td>
<td>PerformanceInformationAvailableNotification <strong>required</strong></td>
<td>Notification about performance information availability.</td>
<td>PerformanceInformationAvailableNotification</td>
</tr>
</tbody>
</table>

**PerformanceInformationAvailableNotification**

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Schema</th>
</tr>
</thead>
<tbody>
<tr>
<td>_links <strong>required</strong></td>
<td>Links to resources related to this notification.</td>
<td>_links</td>
</tr>
<tr>
<td>id <strong>required</strong></td>
<td>An identifier with the intention of being globally unique.</td>
<td>string</td>
</tr>
<tr>
<td>Name</td>
<td>Description</td>

### Responses

<table>
<thead>
<tr>
<th>HTTP Code</th>
<th>Description</th>
<th>Schema</th>
</tr>
</thead>
<tbody>
<tr>
<td>204</td>
<td>204 NO CONTENT Shall be returned when the notification was delivered successfully. <strong>Headers</strong> : <strong>WWW-Authenticate</strong> (string) : Challenge if the corresponding HTTP request has not provided authorization, or error details if the corresponding HTTP request has provided an invalid authorization token. <strong>Version</strong> (string) : Version of the API used in the response.</td>
<td>No Content</td>
</tr>
<tr>
<td>HTTP Code</td>
<td>Description</td>
<td>Schema</td>
</tr>
<tr>
<td>-----------</td>
<td>-------------</td>
<td>--------</td>
</tr>
<tr>
<td>400</td>
<td>400 BAD REQUEST 400 code can be returned in the following specified cases, the specific cause has to be proper specified in the &quot;ProblemDetails&quot; structure to be returned. If the request is malformed or syntactically incorrect (e.g. if the request URI contains incorrect query parameters or the payload body contains a syntactically incorrect data structure), the API producer shall respond with this response code. The &quot;ProblemDetails&quot; structure shall be provided, and should include in the &quot;detail&quot; attribute more information about the source of the problem. If the response to a GET request which queries a container resource would be so big that the performance of the API producer is adversely affected, and the API producer does not support paging for the affected resource, it shall respond with this response code. The &quot;ProblemDetails&quot; structure shall be provided, and should include in the &quot;detail&quot; attribute more information about the source of the problem. If there is an application error related to the client's input that cannot be easily mapped to any other HTTP response code (&quot;catch all error&quot;), the API producer shall respond with this response code. The &quot;ProblemDetails&quot; structure shall be provided, and shall include in the &quot;detail&quot; attribute more information about the source of the problem. If the request contains a malformed access token, the API producer should respond with this response. The details of the error shall be returned in the WWW Authenticate HTTP header, as defined in IETF RFC 6750 and IETF RFC 7235. The ProblemDetails structure may be provided. The use of this HTTP error response code described above is applicable to the use of the OAuth 2.0 for the authorization of API requests and notifications, as defined in clauses 4.5.3.3 and 4.5.3.4.</td>
<td>Response 400</td>
</tr>
</tbody>
</table>

**Headers**:
- `Content-Type` (string) : The MIME type of the body of the response.
- `WWW-Authenticate` (string) : Challenge if the corresponding HTTP request has not provided authorization, or error details if the corresponding HTTP request has provided an invalid authorization token.
- `Version` (string) : Version of the API used in the response.
<table>
<thead>
<tr>
<th>HTTP Code</th>
<th>Description</th>
<th>Schema</th>
</tr>
</thead>
</table>
| 401       | 401 UNAUTHORIZED If the request contains no access token even though one is required, or if the request contains an authorization token that is invalid (e.g. expired or revoked), the API producer should respond with this response. The details of the error shall be returned in the WWW-Authenticate HTTP header, as defined in IETF RFC 6750 and IETF RFC 7235. The ProblemDetails structure may be provided. **Headers**:  
  - `Content-Type` (string): The MIME type of the body of the response.  
  - `WWW-Authenticate` (string): Challenge if the corresponding HTTP request has not provided authorization, or error details if the corresponding HTTP request has provided an invalid authorization token.  
  - `Version` (string): Version of the API used in the response. | **Response 401** |
| 403       | 403 FORBIDDEN If the API consumer is not allowed to perform a particular request to a particular resource, the API producer shall respond with this response code. The "ProblemDetails" structure shall be provided. It should include in the "detail" attribute information about the source of the problem, and may indicate how to solve it. **Headers**:  
  - `Content-Type` (string): The MIME type of the body of the response.  
  - `WWW-Authenticate` (string): Challenge if the corresponding HTTP request has not provided authorization, or error details if the corresponding HTTP request has provided an invalid authorization token.  
  - `Version` (string): Version of the API used in the response. | **Response 403** |
<table>
<thead>
<tr>
<th>HTTP Code</th>
<th>Description</th>
<th>Schema</th>
</tr>
</thead>
</table>
| 404       | 404 NOT FOUND If the API producer did not find a current representation for the resource addressed by the URI passed in the request or is not willing to disclose that one exists, it shall respond with this response code. The "ProblemDetails" structure may be provided, including in the "detail" attribute information about the source of the problem, e.g. a wrong resource URI variable. This response code is not appropriate in case the resource addressed by the URI is a container resource which is designed to contain child resources, but does not contain any child resource at the time the request is received. For a GET request to an existing empty container resource, a typical response contains a 200 OK response code and a payload body with an empty array. **Headers**:  
Content-Type (string) : The MIME type of the body of the response.  
WWW-Authenticate (string) : Challenge if the corresponding HTTP request has not provided authorization, or error details if the corresponding HTTP request has provided an invalid authorization token.  
Version (string) : Version of the API used in the response. |        |
| 405       | 405 METHOD NOT ALLOWED If a particular HTTP method is not supported for a particular resource, the API producer shall respond with this response code. The "ProblemDetails" structure may be omitted. **Headers**:  
Content-Type (string) : The MIME type of the body of the response.  
WWW-Authenticate (string) : Challenge if the corresponding HTTP request has not provided authorization, or error details if the corresponding HTTP request has provided an invalid authorization token.  
Version (string) : Version of the API used in the response. |        |
| 406       | 406 NOT ACCEPTABLE If the "Accept" header does not contain at least one name of a content type that is acceptable to the API producer, the API producer shall respond with this response code. The "ProblemDetails" structure may be omitted. **Headers**:  
Content-Type (string) : The MIME type of the body of the response.  
WWW-Authenticate (string) : Challenge if the corresponding HTTP request has not provided authorization, or error details if the corresponding HTTP request has provided an invalid authorization token.  
Version (string) : Version of the API used in the response. |        |
<table>
<thead>
<tr>
<th>HTTP Code</th>
<th>Description</th>
<th>Schema</th>
</tr>
</thead>
<tbody>
<tr>
<td>500</td>
<td>500 INTERNAL SERVER ERROR If there is an application error not related to the client's input that cannot be easily mapped to any other HTTP response code (“catch all error”), the API producer shall respond with this response code. The &quot;ProblemDetails&quot; structure shall be provided, and shall include in the &quot;detail&quot; attribute more information about the source of the problem.</td>
<td></td>
</tr>
</tbody>
</table>

**Headers:**
- Content-Type (string) : The MIME type of the body of the response.
- WWW-Authenticate (string) : Challenge if the corresponding HTTP request has not provided authorization, or error details if the corresponding HTTP request has provided an invalid authorization token.
- Version (string) : Version of the API used in the response.

| 503 | 503 SERVICE UNAVAILABLE If the API producer encounters an internal overload situation of itself or of a system it relies on, it should respond with this response code, following the provisions in IETF RFC 7231 for the use of the "Retry-After" HTTP header and for the alternative to refuse the connection. The "ProblemDetails" structure may be omitted. |  |

**Headers:**
- Content-Type (string) : The MIME type of the body of the response.
- WWW-Authenticate (string) : Challenge if the corresponding HTTP request has not provided authorization, or error details if the corresponding HTTP request has provided an invalid authorization token.
- Version (string) : Version of the API used in the response.

It is encouraged that the URI provides human-readable documentation for the problem (e.g. using HTML) when dereferenced. When this member is not present, its value is assumed to be "about:blank". | string (URI)

### Test the notification endpoint

| GET | /URI_is_provided_by_the_client_when_creating_the_subscription_PerformanceInformationAvailableNotification |

### Description

The GET method allows the API producer to test the notification endpoint that is provided by the API consumer, e.g. during creation of the PM job or threshold resource. This method shall follow the provisions specified in the Tables 7.4.9.3.2-1 and 7.4.9.3.2-2 for URI query parameters, request and response data structures, and response codes.

### Parameters

<table>
<thead>
<tr>
<th>Type</th>

<td>400 BAD REQUEST 400 code can be returned in the following specified cases, the specific cause has to be properly specified in the &quot;ProblemDetails&quot; structure to be returned. If the request is malformed or syntactically incorrect (e.g. if the request URI contains incorrect query parameters or the payload body contains a syntactically incorrect data structure), the API producer shall respond with this response code. The &quot;ProblemDetails&quot; structure shall be provided, and should include in the &quot;detail&quot; attribute more information about the source of the problem. If the response to a GET request which queries a container resource would be so big that the performance of the API producer is adversely affected, and the API producer does not support paging for the affected resource, it shall respond with this response code. The &quot;ProblemDetails&quot; structure shall be provided, and should include in the &quot;detail&quot; attribute more information about the source of the problem. If there is an application error related to the client's input that cannot be easily mapped to any other HTTP response code (&quot;catch all error&quot;), the API producer shall respond with this response code. The &quot;ProblemDetails&quot; structure shall be provided, and shall include in the &quot;detail&quot; attribute more information about the source of the problem. If the request contains a malformed access token, the API producer should respond with this response. The details of the error shall be returned in the WWW Authenticate HTTP header, as defined in IETF RFC 6750 and IETF RFC 7235. The ProblemDetails structure may be provided. The use of this HTTP error response code described above is applicable to the use of OAuth 2.0 for the authorization of API requests and notifications, as defined in clauses 4.5.3.3 and 4.5.3.4.</td>

The &quot;ProblemDetails&quot; structure may be omitted. <strong>Headers</strong>&lt;br&gt;Content-Type (string) : The MIME type of the body of the response.&lt;br&gt;WWW-Authenticate (string) : Challenge if the corresponding HTTP request has not provided authorization, or error details if the corresponding HTTP request has provided an invalid authorization token.&lt;br&gt;Version (string) : Version of the API used in the response.</td>
<td>Response 406</td>
</tr>
</tbody>
</table>
### HTTP Code 500

**500 INTERNAL SERVER ERROR** If there is an application error not related to the client's input that cannot be easily mapped to any other HTTP response code ("catch all error"), the API producer shall respond with this response code. The "ProblemDetails" structure shall be provided, and shall include in the "detail" attribute more information about the source of the problem.

**Headers**:
- **Content-Type** (string): The MIME type of the body of the response.
- **WWW-Authenticate** (string): Challenge if the corresponding HTTP request has not provided authorization, or error details if the corresponding HTTP request has provided an invalid authorization token.
- **Version** (string): Version of the API used in the response.

### HTTP Code 503

**503 SERVICE UNAVAILABLE** If the API producer encounters an internal overload situation of itself or of a system it relies on, it should respond with this response code, following the provisions in IETF RFC 7231 for the use of the "Retry-After" HTTP header and for the alternative to refuse the connection. The "ProblemDetails" structure may be omitted.

**Headers**:
- **Content-Type** (string): The MIME type of the body of the response.
- **WWW-Authenticate** (string): Challenge if the corresponding HTTP request has not provided authorization, or error details if the corresponding HTTP request has provided an invalid authorization token.
- **Version** (string): Version of the API used in the response.

**Notify about PM related events**

**POST**

/URI_is_provided_by_the_client_when_creating_the_subscription_ThresholdCrossedNotification

**Description**

The POST method delivers a notification regarding a performance management event from the API producer to an API consumer. The API consumer shall have previously created an "Individual PM job resource" or "Individual threshold resource". This method shall follow the provisions specified in the Tables 7.4.9.3.1-1 and 7.4.9.3.1-2 for URI query parameters, request and response data structures, and response codes.

</tbody>
</table>
|           | **Headers** :
|           | **WWW-Authenticate** (string) : Challenge if the corresponding HTTP request has not provided authorization, or error details if the corresponding HTTP request has provided an invalid authorization token. |
|           | **Version** (string) : Version of the API used in the response.                                                                                                                                                     |         |
400 BAD REQUEST 400 code can be returned in the following specified cases, the specific cause has to be properly specified in the "ProblemDetails" structure to be returned. If the request is malformed or syntactically incorrect (e.g. if the request URI contains incorrect query parameters or the payload body contains a syntactically incorrect data structure), the API producer shall respond with this response code. The "ProblemDetails" structure shall be provided, and should include in the "detail" attribute more information about the source of the problem. If the response to a GET request which queries a container resource would be so big that the performance of the API producer is adversely affected, and the API producer does not support paging for the affected resource, it shall respond with this response code. The "ProblemDetails" structure shall be provided, and should include in the "detail" attribute more information about the source of the problem. If there is an application error related to the client’s input that cannot be easily mapped to any other HTTP response code ("catch all error"), the API producer shall respond with this response code. The "ProblemDetails" structure shall be provided, and shall include in the "detail" attribute more information about the source of the problem. If the request contains a malformed access token, the API producer should respond with this response. The details of the error shall be returned in the WWW Authenticate HTTP header, as defined in IETF RFC 6750 and IETF RFC 7235. The ProblemDetails structure may be provided. The use of this HTTP error response code described above is applicable to the use of the OAuth 2.0 for the authorization of API requests and notifications, as defined in clauses 4.5.3.3 and 4.5.3.4.

**Headers**:

- **Content-Type** (string) : The MIME type of the body of the response.
- **WWW-Authenticate** (string) : Challenge if the corresponding HTTP request has not provided authorization, or error details if the corresponding HTTP request has provided an invalid authorization token.
- **Version** (string) : Version of the API used in the response.

### 500 INTERNAL SERVER ERROR

If there is an application error not related to the client's input that cannot be easily mapped to any other HTTP response code ("catch all error"), the API producer shall respond with this response code. The "ProblemDetails" structure shall be provided, and shall include in the "detail" attribute more information about the source of the problem.

**Headers:**

- **Content-Type** (string) : The MIME type of the body of the response.
- **WWW-Authenticate** (string) : Challenge if the corresponding HTTP request has not provided authorization, or error details if the corresponding HTTP request has provided an invalid authorization token.
- **Version** (string) : Version of the API used in the response.

### 503 SERVICE UNAVAILABLE

If the API producer encounters an internal overload situation of itself or of a system it relies on, it should respond with this response code, following the provisions in IETF RFC 7231 for the use of the "Retry-After" HTTP header and for the alternative to refuse the connection. The "ProblemDetails" structure may be omitted.

**Headers:**

- **Content-Type** (string) : The MIME type of the body of the response.
- **WWW-Authenticate** (string) : Challenge if the corresponding HTTP request has not provided authorization, or error details if the corresponding HTTP request has provided an invalid authorization token.
- **Version** (string) : Version of the API used in the response.

### Test the notification endpoint

**GET**

/URI_is_provided_by_the_client_when_creating_the_subscription_ThresholdCrossedNotification

#### Description

The GET method allows the API producer to test the notification endpoint that is provided by the API consumer, e.g. during creation of the PM job or threshold resource. This method shall follow the provisions specified in the Tables 7.4.9.3.2-1 and 7.4.9.3.2-2 for URI query parameters, request and response data structures, and response codes.

#### Parameters

<table>
<thead>
<tr>
