# SOL005 - VNF Package Management Interface

# **Overview**

SOL005 - VNF Package Management Interface IMPORTANT: Please note that this file might be not aligned to the current version of the ETSI Group Specification it refers to and has not been approved by the ETSI NFV ISG. In case of discrepancies the published ETSI Group Specification takes precedence. Please report bugs to https://forge.etsi.org/bugzilla/buglist.cgi?component=Nfv-Openapis

## **Version information**

Version : 2.0.0-impl:etsi.org:ETSI\_NFV\_OpenAPI:1

Description: ETSI GS NFV-SOL 005 V2.6.1

URL: https://www.etsi.org/deliver/etsi\_gs/NFV-SOL/001\_099/005/02.06.01\_60/gs\_NFV-

# **Paths**

# **Retrieve API version information**

GET /api-versions

# **Description**

The GET method reads API version information. This method shall follow the provisions specified in table 4.6.3.3.3.2-1 for request and response data structures, and response codes. URI query parameters are not supported.

#### **Parameters**

| Type   | Name                    | Description  | Schema |
|--------|-------------------------|--|--------|
| Header | <b>Version</b> optional | Version of the API requested to use when responding to this request. | string |

| HTTP<br>Code | Description   | Schema       |
|--------------|---|--------------|
| 200          | API version information was read successfully. The response body shall contain 4.4 API version information, as defined in clause 4.4.1.13.  Headers: Content-Type (string): The MIME type of the body of the response.  Version (string): The used API version. | Response 200 |

| HTTP<br>Code | Description  | Schema       |
|--------------|--|--------------|
| 400          | 400 BAD REQUEST 400 code can be returned in the following specified cases, the specific cause has to be proper specified in the "ProblemDetails" structure to be returned. If the request is malformed or syntactically incorrect (e.g. if the request URI contains incorrect query parameters or the payload body contains a syntactically incorrect data structure), the API producer shall respond with this response code. The "ProblemDetails" structure shall be provided, and should include in the "detail" attribute more information about the source of the problem. If the response to a GET request which queries a container resource would be so big that the performance of the API producer is adversely affected, and the API producer does not support paging for the affected resource, it shall respond with this response code. The "ProblemDetails" structure shall be provided, and should include in the "detail" attribute more information about the source of the problem. If there is an application error related to the client's input that cannot be easily mapped to any other HTTP response code ("catch all error"), the API producer shall respond with this response code. The "ProblemDetails" structure shall be provided, and shall include in the "detail" attribute more information about the source of the problem. If the request contains a malformed access token, the API producer should respond with this response. The details of the error shall be returned in the WWW Authenticate HTTP header, as defined in IETF RFC 6750 and IETF RFC 7235. The ProblemDetails structure may be provided. The use of this HTTP error response code described above is applicable to the use of the OAuth 2.0 for the authorization of API requests and notifications, as defined in clauses 4.5.3.3 and 4.5.3.4.  Headers:  Content-Type (string): The MIME type of the body of the response.  WWW-Authenticate (string): Challenge if the corresponding HTTP request has not provided authorization, or error details if the corresponding HTTP request has provided an invalid auth | Response 400 |

| HTTP<br>Code | Description  | Schema       |
|--------------|--|--------------|
| 401          | 401 UNAUTHORIZED If the request contains no access token even though one is required, or if the request contains an authorization token that is invalid (e.g. expired or revoked), the API producer should respond with this response. The details of the error shall be returned in the WWW-Authenticate HTTP header, as defined in IETF RFC 6750 and IETF RFC 7235. The ProblemDetails structure may be provided.  Headers:  Content-Type (string): The MIME type of the body of the response.  WWW-Authenticate (string): Challenge if the corresponding HTTP request has not provided authorization, or error details if the corresponding HTTP request has provided an invalid authorization token.  Version (string): Version of the API used in the response. | Response 401 |
| 403          | 403 FORBIDDEN If the API consumer is not allowed to perform a particular request to a particular resource, the API producer shall respond with this response code. The "ProblemDetails" structure shall be provided. It should include in the "detail" attribute information about the source of the problem, and may indicate how to solve it.  Headers:  Content-Type (string): The MIME type of the body of the response.  WWW-Authenticate (string): Challenge if the corresponding HTTP request has not provided authorization, or error details if the corresponding HTTP request has provided an invalid authorization token.  Version (string): Version of the API used in the response.   | Response 403 |

| HTTP<br>Code | Description   | Schema       |
|--------------|---|--------------|
| 404          | 404 NOT FOUND If the API producer did not find a current representation for the resource addressed by the URI passed in the request or is not willing to disclose that one exists, it shall respond with this response code. The "ProblemDetails" structure may be provided, including in the "detail" attribute information about the source of the problem, e.g. a wrong resource URI variable. This response code is not appropriate in case the resource addressed by the URI is a container resource which is designed to contain child resources, but does not contain any child resource at the time the request is received. For a GET request to an existing empty container resource, a typical response contains a 200 OK response code and a payload body with an empty array.  Headers:  Content-Type (string): The MIME type of the body of the response.  WWW-Authenticate (string): Challenge if the corresponding HTTP request has not provided authorization, or error details if the corresponding HTTP request has provided an invalid authorization token.  Version (string): Version of the API used in the response. | Response 404 |
| 405          | 405 METHOD NOT ALLOWED If a particular HTTP method is not supported for a particular resource, the API producer shall respond with this response code. The "ProblemDetails" structure may be omitted.  Headers: Content-Type (string): The MIME type of the body of the response.  WWW-Authenticate (string): Challenge if the corresponding HTTP request has not provided authorization, or error details if the corresponding HTTP request has provided an invalid authorization token.  Version (string): Version of the API used in the response.   | Response 405 |
| 406          | 406 NOT ACCEPTABLE If the "Accept" header does not contain at least one name of a content type that is acceptable to the API producer, the API producer shall respond with this response code. The "ProblemDetails" structure may be omitted.  Headers:  Content-Type (string): The MIME type of the body of the response.  WWW-Authenticate (string): Challenge if the corresponding HTTP request has not provided authorization, or error details if the corresponding HTTP request has provided an invalid authorization token.  Version (string): Version of the API used in the response.  | Response 406 |

| HTTP<br>Code | Description   | Schema       |
|--------------|---|--------------|
| 413          | 413 PAYLOAD TOO LARGE If the payload body of a request is larger than the amount of data the API producer is willing or able to process, it shall respond with this response code, following the provisions in IETF RFC 7231 for the use of the "Retry-After" HTTP header and for closing the connection. The "ProblemDetails" structure may be omitted.  Headers:  Content-Type (string): The MIME type of the body of the response.  WWW-Authenticate (string): Challenge if the corresponding HTTP request has not provided authorization, or error details if the corresponding HTTP request has provided an invalid authorization token.  Version (string): Version of the API used in the response. | Response 413 |
| 414          | 414 URI TOO LONG If the request URI of a request is longer than the API producer is willing or able to process, it shall respond with this response code. This condition can e.g. be caused by passing long queries in the request URI of a GET request. The "ProblemDetails" structure may be omitted.  Headers:  Content-Type (string): The MIME type of the body of the response.  WWW-Authenticate (string): Challenge if the corresponding HTTP request has not provided authorization, or error details if the corresponding HTTP request has provided an invalid authorization token.  Version (string): Version of the API used in the response.  | Response 414 |
| 416          | 416 RANGE NOT SATISFIABLE  Headers: Content-Type (string): The MIME type of the body of the response.  WWW-Authenticate (string): Challenge if the corresponding HTTP request has not provided authorization, or error details if the corresponding HTTP request has provided an invalid authorization token.  Version (string): Version of the API used in the response.   | Response 416 |

| HTTP<br>Code | Description   | Schema       |
|--------------|---|--------------|
| 422          | 422 UNPROCESSABLE ENTITY If the payload body of a request contains syntactically correct data (e.g. well-formed JSON) but the data cannot be processed (e.g. because it fails validation against a schema), the API producer shall respond with this response code. The "ProblemDetails" structure shall be provided, and should include in the "detail" attribute more information about the source of the problem. This error response code is only applicable for methods that have a request body.  Headers:  Content-Type (string): The MIME type of the body of the response.  WWW-Authenticate (string): Challenge if the corresponding HTTP request has not provided authorization, or error details if the corresponding HTTP request has provided an invalid authorization token.  Version (string): Version of the API used in the response.   | Response 422 |
| 429          | 429 TOO MANY REQUESTS If the API consumer has sent too many requests in a defined period of time and the API producer is able to detect that condition ("rate limiting"), the API producer shall respond with this response code, following the provisions in IETF RFC 6585 [17] for the use of the "Retry-After" HTTP header. The "ProblemDetails" structure shall be provided and shall include in the "detail" attribute more information about the source of the problem. The period of time and allowed number of requests are configured within the API producer by means outside the scope of the present document.  Headers:  Content-Type (string): The MIME type of the body of the response.  WWW-Authenticate (string): Challenge if the corresponding HTTP request has not provided authorization, or error details if the corresponding HTTP request has provided an invalid authorization token.  Version (string): Version of the API used in the response. | Response 429 |

| HTTP<br>Code | Description   | Schema       |
|--------------|---|--------------|
| 500          | 500 INTERNAL SERVER ERROR If there is an application error not related to the client's input that cannot be easily mapped to any other HTTP response code ("catch all error"), the API producer shall respond with this response code. The "ProblemDetails" structure shall be provided, and shall include in the "detail" attribute more information about the source of the problem.  Headers:  Content-Type (string): The MIME type of the body of the response.  WWW-Authenticate (string): Challenge if the corresponding HTTP request has not provided authorization, or error details if the corresponding HTTP request has provided an invalid authorization token.  Version (string): Version of the API used in the response. | Response 500 |
| 503          | 503 SERVICE UNAVAILABLE If the API producer encounters an internal overload situation of itself or of a system it relies on, it should respond with this response code, following the provisions in IETF RFC 7231 for the use of the "Retry-After" HTTP header and for the alternative to refuse the connection. The "ProblemDetails" structure may be omitted.  Headers:  Content-Type (string): The MIME type of the body of the response.  WWW-Authenticate (string): Challenge if the corresponding HTTP request has not provided authorization, or error details if the corresponding HTTP request has provided an invalid authorization token.  Version (string): Version of the API used in the response.                        | Response 503 |
| 504          | 504 GATEWAY TIMEOUT If the API producer encounters a timeout while waiting for a response from an upstream server (i.e. a server that the API producer communicates with when fulfilling a request), it should respond with this response code.  Headers:  Content-Type (string): The MIME type of the body of the response.  WWW-Authenticate (string): Challenge if the corresponding HTTP request has not provided authorization, or error details if the corresponding HTTP request has provided an invalid authorization token.  Version (string): Version of the API used in the response.  | Response 504 |

| Name                           | Description   | Schema                |
|--------------------------------|---|-----------------------|
| <b>apiVersions</b><br>required | Version(s) supported for the API signalled by the uriPrefix attribute.                              | < apiVersions > array |
| <b>uriPrefix</b> required      | Specifies the URI prefix for the API, in the following form {apiRoot}/{apiName}/{apiMajorVersion}/. | string                |

# apiVersions

| Name                         | Description  | Schema  |
|------------------------------|--|---------|
| <b>isDeprecated</b> optional | The Boolean is a data type having two values (TRUE and FALSE).   | boolean |
| version<br>required          | Identifies a supported version. The value of the version attribute shall be a version identifier as specified in clause 4.6.1. | string  |

| Name                     | Description   | Schema  |
|--------------------------|---|---------|
| <b>detail</b> required   | A human-readable explanation specific to this occurrence of the problem.  | string  |
| instance<br>optional     | A URI reference that identifies the specific occurrence of<br>the problem. It may yield further information if<br>dereferenced.   |         |
| status<br>required       | The HTTP status code for this occurrence of the problem. The HTTP status code ([RFC7231], Section 6) generated by the origin server for this occurrence of the problem.   | integer |
| <b>title</b><br>optional | A short, human-readable summary of the problem type. It should not change from occurrence to occurrence of the problem, except for purposes of localization. If type is given and other than "about:blank", this attribute shall also be provided. A short, human-readable summary of the problem type. It SHOULD NOT change from occurrence to occurrence of the problem, except for purposes of localization (e.g., using proactive content negotiation; see [RFC7231], Section 3.4). | string  |

| Name                    | Description  | Schema       |
|-------------------------|--|--------------|
| <b>type</b><br>optional | A URI reference according to IETF RFC 3986 [5] that identifies the problem type. It is encouraged that the URI provides human-readable documentation for the problem (e.g. using HTML) when dereferenced. When this member is not present, its value is assumed to be "about:blank". | string (URI) |

| Name                     | Description   | Schema       |
|--------------------------|---|--------------|
| <b>detail</b> required   | A human-readable explanation specific to this occurrence of the problem.  | string       |

| Name | Description  | Schema |
|------|--|--------|
|      | A human-readable explanation specific to this occurrence of the problem. | string |

| Name                     | Description   | Schema  |
|--------------------------|---|---------|
| instance<br>optional     | A URI reference that identifies the specific occurrence of<br>the problem. It may yield further information if<br>dereferenced.   |         |
| <b>status</b> required   | The HTTP status code for this occurrence of the problem. The HTTP status code ([RFC7231], Section 6) generated by the origin server for this occurrence of the problem.   | integer |
| <b>title</b><br>optional | A short, human-readable summary of the problem type. It should not change from occurrence to occurrence of the problem, except for purposes of localization. If type is given and other than "about:blank", this attribute shall also be provided. A short, human-readable summary of the problem type. It SHOULD NOT change from occurrence to occurrence of the problem, except for purposes of localization (e.g., using proactive content negotiation; see [RFC7231], Section 3.4). | string  |
| <b>type</b><br>optional  | A URI reference according to IETF RFC 3986 [5] that identifies the problem type. It is encouraged that the URI provides human-readable documentation for the problem (e.g. using HTML) when dereferenced. When this member is not present, its value is assumed to be "about:blank".  |         |

# Subscribe to notifications related to on-boarding and/or changes of VNF packages.

POST /subscriptions

#### **Description**

The POST method creates a new subscription. This method shall follow the provisions specified in the Tables 9.4.8.3.1-1 and 9.4.8.3.1-2 for URI query parameters, request and response data structures, and response codes. As the result of successfully executing this method, a new "Individual subscription" resource shall exist as defined in clause 9.4.9. This method shall not trigger any notification. Creation of two subscription resources with the same callbackURI and the same filter can result in performance degradation and will provide duplicates of notifications to the OSS, and might make sense only in very rare use cases. Consequently, the NFVO may either allow creating a subscription resource if another subscription resource with the same filter and callbackUri already exists (in which case it shall return the "201 Created" response code), or may decide to not create a duplicate subscription resource (in which case it shall return a "303 See Other" response code referencing the existing subscription resource with the same filter and callbackUri).

#### **Parameters**

| Type   | Name                    | Description   | Schema |
|--------|-------------------------|---|--------|
| Header | Accept<br>required      | Content-Types that are acceptable for the response. Reference: IETF RFC 7231  | string |
| Header | Authorization optional  | The authorization token for the request. Reference: IETF RFC 7235.  | string |
| Header | Content-Type required   | The MIME type of the body of the request. Reference: IETF RFC 7231  | string |
| Header | <b>Version</b> required | Version of the API requested to use when responding to this request.  | string |
| Body   | <b>body</b><br>required | Representation of the created subscription resource. The HTTP response shall include a "Location" HTTP header that points to the created subscription resource. |        |

#### body

| Name                           | Description                                  | Schema         |
|--------------------------------|--|----------------|
| authenticatio<br>n<br>optional |  | authentication |
| <b>callbackUri</b><br>required | String formatted according to IETF RFC 3986. | string (uri)   |

| Name                      | Description  | Schema |
|---------------------------|--|--------|
| <b>filter</b><br>optional | This type represents a subscription filter related to notifications related to VNF package management. At a particular nesting level in the filter structure, the following applies: All attributes shall match in order for the filter to match (logical "and" between different filter attributes). If an attribute is an array, the attribute shall match if at least one of the values in the array matches (logical "or" between the values of one filter attribute). | filter |

#### authentication

| Name                                     | Description  | Schema  |
|--|--|---|
| <b>authType</b><br>required              | Defines the types of Authentication / Authorization which the API consumer is willing to accept when receiving a notification. Permitted values: - BASIC: In every HTTP request to the notification endpoint, use HTTP Basic authentication with the client credentials OAUTH2_CLIENT_CREDENTIALS: In every HTTP request to the notification endpoint, use an OAuth 2.0 Bearer token, obtained using the client credentials grant type TLS_CERT: Every HTTP request to the notification endpoint is sent over a mutually authenticated TLS session, i.e. not only the server is authenticated, but also the client is authenticated during the TLS tunnel setup. | OAUTH2_CLIENT_CR<br>EDENTIALS,<br>TLS_CERT) > array |
| paramsBasic<br>optional                  | Parameters for authentication/authorization using BASIC. Shall be present if authType is "BASIC" and the contained information has not been provisioned out of band. Shall be absent otherwise.  | paramsBasic   |
| paramsOauth 2ClientCreden tials optional | Parameters for authentication/authorization using OAUTH2_CLIENT_CREDENTIALS. Shall be present if authType is "OAUTH2_CLIENT_CREDENTIALS" and the contained information has not been provisioned out of band. Shall be absent otherwise.  | paramsOauth2Client<br>Credentials                   |

#### paramsBasic

| Name                 | Description  | Schema |
|----------------------|--|--------|
| password<br>optional | Password to be used in HTTP Basic authentication. Shall be present if it has not been provisioned out of band. | string |

| Name                 | Description  | Schema |
|----------------------|--|--------|
| userName<br>optional | Username to be used in HTTP Basic authentication. Shall be present if it has not been provisioned out of band. | string |

# params O auth 2 Client Credentials

| Name                           | Description   | Schema       |
|--------------------------------|---|--------------|
| clientId<br>optional           | Client identifier to be used in the access token request of the OAuth 2.0 client credentials grant type. Shall be present if it has not been provisioned out of band. The clientId and clientPassword passed in a subscription shall not be the same as the clientId and clientPassword that are used to obtain authorization for API requests. Client credentials may differ between subscriptions. The value of clientPassword should be generated by a random process. | string       |
| clientPasswor<br>d<br>optional | Client password to be used in the access token request of the OAuth 2.0 client credentials grant type. Shall be present if it has not been provisioned out of band. The clientId and clientPassword passed in a subscription shall not be the same as the clientId and clientPassword that are used to obtain authorization for API requests. Client credentials may differ between subscriptions. The value of clientPassword should be generated by a random process.   |              |
| tokenEndpoin<br>t<br>optional  | String formatted according to IETF RFC 3986.  | string (uri) |

#### filter

| Name                                     | Description  | Schema  |
|--|--|---|
| notificationTy<br>pes<br>optional        | Match particular notification types. Permitted values: -<br>VnfPackageOnboardingNotification -<br>VnfPackageChangeNotification | enum (VnfPackageOnboar dingNotification, VnfPackageChangeN otification) |
| vnfProductsFr<br>omProviders<br>optional | If present, match VNF packages that contain VNF products from certain providers.   | <pre>  vnfProductsFromPr   oviders &gt; array</pre>                     |

#### vnfProductsFromProviders

| Name                             | Description   | Schema                                    |
|----------------------------------|---|---|
| operationalSt<br>ate<br>optional | Match VNF packages with a package identifier listed in the attribute. May be present if the "notificationTypes" attribute contains the value "VnfPackageChangeNotification", and shall be absent otherwise. | < enum (ENABLED,<br>DISABLED) > array     |
| <b>usageState</b><br>optional    | Match particular usage state of the on-boarded VNF package. May be present if the "notificationTypes" attribute contains the value "VnfPackageChangeNotification", and shall be absent otherwise.           | < enum (IN_USE,<br>NOT_IN_USE) ><br>array |
| vnfPkgId<br>optional             | Match VNF packages with a package identifier listed in the attribute. May be present if the "notificationTypes" attribute contains the value "VnfPackageChangeNotification", and shall be absent otherwise. | < string > array                          |
| vnfProducts<br>optional          | If present, match VNF packages that contain VNF products with certain product names, from one particular provider.  | < vnfProducts > array                     |
| vnfProvider<br>required          | Name of the VNFprovider to match.   | string                                    |
| vnfdId<br>optional               | Match VNF packages with a VNFD identifier listed in the attribute.  | < string > array                          |

#### vnfProducts

| Name                           | Description  | Schema |
|--------------------------------|--|--------|
| versions<br>optional           | If present, match VNF packages that contain VNF products with certain versions and a certain product name, from one particular provider. |        |
| vnfProductNa<br>me<br>required | Name of the VNF product to match.  | string |

#### versions

| Name                               | Description   | Schema |
|------------------------------------|---|--------|
| vnfSoftwareV<br>ersion<br>required | A Version. Representation: string of variable length.   | string |
| vnfdVersions<br>optional           | If present, match VNF packages that contain VNF products with certain VNFD versions, a certain software version and a certain product name, from one particular provider. |        |

| HTTP<br>Code | Description   | Schema                 |
|--------------|---|------------------------|
| 201          | 201 Created Shall be returned when the subscription has been created successfully. The response body shall contain a representation of the created subscription resource. The HTTP response shall include a "Location" HTTP header that points to the created subscription resource.  Headers:  Content-Type (string): The MIME type of the body of the response.  WWW-Authenticate (string): Challenge if the corresponding HTTP request has not provided authorization, or error details if the corresponding HTTP request has provided an invalid authorization token.  Version (string): Version of the API used in the response. | < Response 201 > array |
| 303          | 303 SEE OTHER  Headers: Content-Type (string): The MIME type of the body of the response.  WWW-Authenticate (string): Challenge if the corresponding HTTP request has not provided authorization, or error details if the corresponding HTTP request has provided an invalid authorization token.  Version (string): Version of the API used in the response.   | No Content             |

| HTTP<br>Code | Description  | Schema       |
|--------------|--|--------------|
| 400          | 400 BAD REQUEST 400 code can be returned in the following specified cases, the specific cause has to be proper specified in the "ProblemDetails" structure to be returned. If the request is malformed or syntactically incorrect (e.g. if the request URI contains incorrect query parameters or the payload body contains a syntactically incorrect data structure), the API producer shall respond with this response code. The "ProblemDetails" structure shall be provided, and should include in the "detail" attribute more information about the source of the problem. If the response to a GET request which queries a container resource would be so big that the performance of the API producer is adversely affected, and the API producer does not support paging for the affected resource, it shall respond with this response code. The "ProblemDetails" structure shall be provided, and should include in the "detail" attribute more information about the source of the problem. If there is an application error related to the client's input that cannot be easily mapped to any other HTTP response code ("catch all error"), the API producer shall respond with this response code. The "ProblemDetails" structure shall be provided, and shall include in the "detail" attribute more information about the source of the problem. If the request contains a malformed access token, the API producer should respond with this response. The details of the error shall be returned in the WWW Authenticate HTTP header, as defined in IETF RFC 6750 and IETF RFC 7235. The ProblemDetails structure may be provided. The use of this HTTP error response code described above is applicable to the use of the OAuth 2.0 for the authorization of API requests and notifications, as defined in clauses 4.5.3.3 and 4.5.3.4.  Headers:  Content-Type (string): The MIME type of the body of the response.  WWW-Authenticate (string): Challenge if the corresponding HTTP request has not provided authorization, or error details if the corresponding HTTP request has provided an invalid auth | Response 400 |

| HTTP<br>Code | Description  | Schema       |
|--------------|--|--------------|
| 401          | 401 UNAUTHORIZED If the request contains no access token even though one is required, or if the request contains an authorization token that is invalid (e.g. expired or revoked), the API producer should respond with this response. The details of the error shall be returned in the WWW-Authenticate HTTP header, as defined in IETF RFC 6750 and IETF RFC 7235. The ProblemDetails structure may be provided.  Headers:  Content-Type (string): The MIME type of the body of the response.  WWW-Authenticate (string): Challenge if the corresponding HTTP request has not provided authorization, or error details if the corresponding HTTP request has provided an invalid authorization token.  Version (string): Version of the API used in the response. | Response 401 |
| 403          | 403 FORBIDDEN If the API consumer is not allowed to perform a particular request to a particular resource, the API producer shall respond with this response code. The "ProblemDetails" structure shall be provided. It should include in the "detail" attribute information about the source of the problem, and may indicate how to solve it.  Headers:  Content-Type (string): The MIME type of the body of the response.  WWW-Authenticate (string): Challenge if the corresponding HTTP request has not provided authorization, or error details if the corresponding HTTP request has provided an invalid authorization token.  Version (string): Version of the API used in the response.   | Response 403 |

| HTTP<br>Code | Description   | Schema       |
|--------------|---|--------------|
| 404          | 404 NOT FOUND If the API producer did not find a current representation for the resource addressed by the URI passed in the request or is not willing to disclose that one exists, it shall respond with this response code. The "ProblemDetails" structure may be provided, including in the "detail" attribute information about the source of the problem, e.g. a wrong resource URI variable. This response code is not appropriate in case the resource addressed by the URI is a container resource which is designed to contain child resources, but does not contain any child resource at the time the request is received. For a GET request to an existing empty container resource, a typical response contains a 200 OK response code and a payload body with an empty array.  Headers:  Content-Type (string): The MIME type of the body of the response.  WWW-Authenticate (string): Challenge if the corresponding HTTP request has not provided authorization, or error details if the corresponding HTTP request has provided an invalid authorization token.  Version (string): Version of the API used in the response. | Response 404 |
| 405          | 405 METHOD NOT ALLOWED If a particular HTTP method is not supported for a particular resource, the API producer shall respond with this response code. The "ProblemDetails" structure may be omitted.  Headers: Content-Type (string): The MIME type of the body of the response.  WWW-Authenticate (string): Challenge if the corresponding HTTP request has not provided authorization, or error details if the corresponding HTTP request has provided an invalid authorization token.  Version (string): Version of the API used in the response.   | Response 405 |
| 406          | 406 NOT ACCEPTABLE If the "Accept" header does not contain at least one name of a content type that is acceptable to the API producer, the API producer shall respond with this response code. The "ProblemDetails" structure may be omitted.  Headers:  Content-Type (string): The MIME type of the body of the response.  WWW-Authenticate (string): Challenge if the corresponding HTTP request has not provided authorization, or error details if the corresponding HTTP request has provided an invalid authorization token.  Version (string): Version of the API used in the response.  | Response 406 |

| HTTP<br>Code | Description   | Schema       |
|--------------|---|--------------|
| 416          | 416 RANGE NOT SATISFIABLE  Headers: Content-Type (string): The MIME type of the body of the response.  WWW-Authenticate (string): Challenge if the corresponding HTTP request has not provided authorization, or error details if the corresponding HTTP request has provided an invalid authorization token.  Version (string): Version of the API used in the response.   | Response 416 |
| 500          | 500 INTERNAL SERVER ERROR If there is an application error not related to the client's input that cannot be easily mapped to any other HTTP response code ("catch all error"), the API producer shall respond with this response code. The "ProblemDetails" structure shall be provided, and shall include in the "detail" attribute more information about the source of the problem.  Headers:  Content-Type (string): The MIME type of the body of the response.  WWW-Authenticate (string): Challenge if the corresponding HTTP request has not provided authorization, or error details if the corresponding HTTP request has provided an invalid authorization token.  Version (string): Version of the API used in the response. | Response 500 |
| 503          | 503 SERVICE UNAVAILABLE If the API producer encounters an internal overload situation of itself or of a system it relies on, it should respond with this response code, following the provisions in IETF RFC 7231 for the use of the "Retry-After" HTTP header and for the alternative to refuse the connection. The "ProblemDetails" structure may be omitted.  Headers:  Content-Type (string): The MIME type of the body of the response.  WWW-Authenticate (string): Challenge if the corresponding HTTP request has not provided authorization, or error details if the corresponding HTTP request has provided an invalid authorization token.  Version (string): Version of the API used in the response.                        | Response 503 |

| Name               | Description                                  | Schema |
|--------------------|--|--------|
| _links<br>required | Links to resources related to this resource. | _links |

| Name                           | Description  | Schema       |
|--------------------------------|--|--------------|
| <b>callbackUri</b><br>required | String formatted according to IETF RFC 3986.   | string (uri) |
| <b>filter</b><br>optional      | This type represents a subscription filter related to notifications related to VNF package management. At a particular nesting level in the filter structure, the following applies: All attributes shall match in order for the filter to match (logical "and" between different filter attributes). If an attribute is an array, the attribute shall match if at least one of the values in the array matches (logical "or" between the values of one filter attribute). | filter       |

# Query multiple subscriptions.

GET /subscriptions

# **Description**

The GET method queries the list of active subscriptions of the functional block that invokes the method. It can be used e.g. for resynchronization after error situations. This method shall follow the provisions specified in the Tables 9.4.7.8.2-1 and 9.4.8.3.2-2 for URI query parameters, request and response data structures, and response codes.

#### **Parameters**

| Туре   | Name                                   | Description  | Schema |
|--------|--|--|--------|
| Header | <b>Accept</b> required                 | Content-Types that are acceptable for the response. Reference: IETF RFC 7231   | string |
| Header | <b>Authorization</b> optional          | The authorization token for the request. Reference: IETF RFC 7235.   | string |
| Header | <b>Version</b> required                | Version of the API requested to use when responding to this request.   | string |
| Query  | <b>filter</b><br>optional              | Attribute-based filtering expression according to clause 5.2 of ETSI GS NFV SOL 013. The NFVO shall support receiving this filtering parameter as part of the URI query string. The OSS/BSS may supply this filtering parameter. All attribute names that appear in the PkgmSubscription and in data types referenced from it shall be supported by the NFVO in the filtering expression |        |
| Query  | nextpage_opa<br>que_marker<br>optional | Marker to obtain the next page of a paged response. Shall be supported by the NFVO if the NFVO supports alternative 2 (paging) according to clause 5.4.2.1 of ETSI GS NFV-SOL 013 for this resource.   | string |

| HTTP<br>Code | Description  | Schema                 |
|--------------|--|------------------------|
| 200          | 200 OK Shall be returned when the list of subscriptions has been queried successfully. The response body shall contain in an array the representations of all active subscriptions of the functional block that invokes the method, i.e. zero or more representations of VNF package management subscriptions, as defined in clause 9.5.2.7. If the "filter" URI parameter was supplied in the request, the data in the response body shall have been transformed according to the rules specified in clause 5.2.2 of ETSI GS NFV-SOL 013. If the NFVO supports alternative 2 (paging) according to clause 5.4.2.1 of ETSI GS NFV SOL 013 for this resource, inclusion of the Link HTTP header in this response shall follow the provisions in clause 5.4.2.3 of ETSI GS NFV SOL 013.  Headers:  Content-Type (string): The MIME type of the body of the response.  WWW-Authenticate (string): Challenge if the corresponding HTTP request has not provided authorization, or error details if the corresponding HTTP request has provided an invalid authorization token.  Version (string): Version of the API used in the response. | < Response 200 > array |

| HTTP<br>Code | Description  | Schema       |
|--------------|--|--------------|
| 400          | 400 BAD REQUEST 400 code can be returned in the following specified cases, the specific cause has to be proper specified in the "ProblemDetails" structure to be returned. If the request is malformed or syntactically incorrect (e.g. if the request URI contains incorrect query parameters or the payload body contains a syntactically incorrect data structure), the API producer shall respond with this response code. The "ProblemDetails" structure shall be provided, and should include in the "detail" attribute more information about the source of the problem. If the response to a GET request which queries a container resource would be so big that the performance of the API producer is adversely affected, and the API producer does not support paging for the affected resource, it shall respond with this response code. The "ProblemDetails" structure shall be provided, and should include in the "detail" attribute more information about the source of the problem. If there is an application error related to the client's input that cannot be easily mapped to any other HTTP response code ("catch all error"), the API producer shall respond with this response code. The "ProblemDetails" structure shall be provided, and shall include in the "detail" attribute more information about the source of the problem. If the request contains a malformed access token, the API producer should respond with this response. The details of the error shall be returned in the WWW Authenticate HTTP header, as defined in IETF RFC 6750 and IETF RFC 7235. The ProblemDetails structure may be provided. The use of this HTTP error response code described above is applicable to the use of the OAuth 2.0 for the authorization of API requests and notifications, as defined in clauses 4.5.3.3 and 4.5.3.4.  Headers:  Content-Type (string): The MIME type of the body of the response.  WWW-Authenticate (string): Challenge if the corresponding HTTP request has not provided authorization, or error details if the corresponding HTTP request has provided an invalid auth | Response 400 |

| HTTP<br>Code | Description  | Schema       |
|--------------|--|--------------|
| 401          | 401 UNAUTHORIZED If the request contains no access token even though one is required, or if the request contains an authorization token that is invalid (e.g. expired or revoked), the API producer should respond with this response. The details of the error shall be returned in the WWW-Authenticate HTTP header, as defined in IETF RFC 6750 and IETF RFC 7235. The ProblemDetails structure may be provided.  Headers:  Content-Type (string): The MIME type of the body of the response.  WWW-Authenticate (string): Challenge if the corresponding HTTP request has not provided authorization, or error details if the corresponding HTTP request has provided an invalid authorization token.  Version (string): Version of the API used in the response. | Response 401 |
| 403          | 403 FORBIDDEN If the API consumer is not allowed to perform a particular request to a particular resource, the API producer shall respond with this response code. The "ProblemDetails" structure shall be provided. It should include in the "detail" attribute information about the source of the problem, and may indicate how to solve it.  Headers:  Content-Type (string): The MIME type of the body of the response.  WWW-Authenticate (string): Challenge if the corresponding HTTP request has not provided authorization, or error details if the corresponding HTTP request has provided an invalid authorization token.  Version (string): Version of the API used in the response.   | Response 403 |

| HTTP<br>Code | Description   | Schema       |
|--------------|---|--------------|
| 404          | 404 NOT FOUND If the API producer did not find a current representation for the resource addressed by the URI passed in the request or is not willing to disclose that one exists, it shall respond with this response code. The "ProblemDetails" structure may be provided, including in the "detail" attribute information about the source of the problem, e.g. a wrong resource URI variable. This response code is not appropriate in case the resource addressed by the URI is a container resource which is designed to contain child resources, but does not contain any child resource at the time the request is received. For a GET request to an existing empty container resource, a typical response contains a 200 OK response code and a payload body with an empty array.  Headers:  Content-Type (string): The MIME type of the body of the response.  WWW-Authenticate (string): Challenge if the corresponding HTTP request has not provided authorization, or error details if the corresponding HTTP request has provided an invalid authorization token.  Version (string): Version of the API used in the response. |              |
| 405          | 405 METHOD NOT ALLOWED If a particular HTTP method is not supported for a particular resource, the API producer shall respond with this response code. The "ProblemDetails" structure may be omitted.  Headers: Content-Type (string): The MIME type of the body of the response.  WWW-Authenticate (string): Challenge if the corresponding HTTP request has not provided authorization, or error details if the corresponding HTTP request has provided an invalid authorization token.  Version (string): Version of the API used in the response.   | Response 405 |
| 406          | 406 NOT ACCEPTABLE If the "Accept" header does not contain at least one name of a content type that is acceptable to the API producer, the API producer shall respond with this response code. The "ProblemDetails" structure may be omitted.  Headers:  Content-Type (string): The MIME type of the body of the response.  WWW-Authenticate (string): Challenge if the corresponding HTTP request has not provided authorization, or error details if the corresponding HTTP request has provided an invalid authorization token.  Version (string): Version of the API used in the response.  | Response 406 |

| HTTP<br>Code | Description   | Schema       |
|--------------|---|--------------|
| 416          | 416 RANGE NOT SATISFIABLE  Headers: Content-Type (string): The MIME type of the body of the response.  WWW-Authenticate (string): Challenge if the corresponding HTTP request has not provided authorization, or error details if the corresponding HTTP request has provided an invalid authorization token.  Version (string): Version of the API used in the response.   | Response 416 |
| 500          | 500 INTERNAL SERVER ERROR If there is an application error not related to the client's input that cannot be easily mapped to any other HTTP response code ("catch all error"), the API producer shall respond with this response code. The "ProblemDetails" structure shall be provided, and shall include in the "detail" attribute more information about the source of the problem.  Headers:  Content-Type (string): The MIME type of the body of the response.  WWW-Authenticate (string): Challenge if the corresponding HTTP request has not provided authorization, or error details if the corresponding HTTP request has provided an invalid authorization token.  Version (string): Version of the API used in the response. | Response 500 |
| 503          | 503 SERVICE UNAVAILABLE If the API producer encounters an internal overload situation of itself or of a system it relies on, it should respond with this response code, following the provisions in IETF RFC 7231 for the use of the "Retry-After" HTTP header and for the alternative to refuse the connection. The "ProblemDetails" structure may be omitted.  Headers:  Content-Type (string): The MIME type of the body of the response.  WWW-Authenticate (string): Challenge if the corresponding HTTP request has not provided authorization, or error details if the corresponding HTTP request has provided an invalid authorization token.  Version (string): Version of the API used in the response.                        | Response 503 |

| Name               | Description                                  | Schema |
|--------------------|--|--------|
| _links<br>required | Links to resources related to this resource. | _links |

| Name                           | Description  | Schema       |
|--------------------------------|--|--------------|
| <b>callbackUri</b><br>required | String formatted according to IETF RFC 3986.   | string (uri) |
| <b>filter</b><br>optional      | This type represents a subscription filter related to notifications related to VNF package management. At a particular nesting level in the filter structure, the following applies: All attributes shall match in order for the filter to match (logical "and" between different filter attributes). If an attribute is an array, the attribute shall match if at least one of the values in the array matches (logical "or" between the values of one filter attribute). | filter       |
| <b>id</b><br>required          | String formatted according to IETF RFC 3986.   | string (uri) |

#### \_links

| Name                 | Description                                | Schema |
|----------------------|--|--------|
| <b>self</b> required | This type represents a link to a resource. | self   |

#### $\boldsymbol{self}$

| Name                 | Description  | Schema |
|----------------------|--|--------|
| <b>href</b> required | URI of a resource referenced from a notification. Should be an absolute URI (i.e. a URI that contains {apiRoot}), however, may be a relative URI (i.e. a URI where the {apiRoot} part is omitted) if the {apiRoot} information is not available. |        |

#### filter

| Name                                     | Description  | Schema  |
|--|--|---|
| notificationTy<br>pes<br>optional        | Match particular notification types. Permitted values: -<br>VnfPackageOnboardingNotification -<br>VnfPackageChangeNotification | enum (VnfPackageOnboar dingNotification, VnfPackageChangeN otification) |
| vnfProductsFr<br>omProviders<br>optional | If present, match VNF packages that contain VNF products from certain providers.   | <pre>  vnfProductsFromPr   oviders &gt; array</pre>                     |

#### vnfProductsFromProviders

| Name                             | Description   | Schema                                    |
|----------------------------------|---|---|
| operationalSt<br>ate<br>optional | Match VNF packages with a package identifier listed in the attribute. May be present if the "notificationTypes" attribute contains the value "VnfPackageChangeNotification", and shall be absent otherwise. | < enum (ENABLED,<br>DISABLED) > array     |
| <b>usageState</b><br>optional    | Match particular usage state of the on-boarded VNF package. May be present if the "notificationTypes" attribute contains the value "VnfPackageChangeNotification", and shall be absent otherwise.           | < enum (IN_USE,<br>NOT_IN_USE) ><br>array |
| vnfPkgId<br>optional             | Match VNF packages with a package identifier listed in the attribute. May be present if the "notificationTypes" attribute contains the value "VnfPackageChangeNotification", and shall be absent otherwise. | < string > array                          |
| vnfProducts<br>optional          | If present, match VNF packages that contain VNF products with certain product names, from one particular provider.  | < vnfProducts > array                     |
| vnfProvider<br>required          | Name of the VNFprovider to match.   | string                                    |
| vnfdId<br>optional               | Match VNF packages with a VNFD identifier listed in the attribute.  | < string > array                          |

#### vnfProducts

| Name                           | Description  | Schema |
|--------------------------------|--|--------|
| versions<br>optional           | If present, match VNF packages that contain VNF products with certain versions and a certain product name, from one particular provider. |        |
| vnfProductNa<br>me<br>required | Name of the VNF product to match.  | string |

#### versions

| Name                               | Description   | Schema |
|------------------------------------|---|--------|
| vnfSoftwareV<br>ersion<br>required | A Version. Representation: string of variable length.   | string |
| vnfdVersions<br>optional           | If present, match VNF packages that contain VNF products with certain VNFD versions, a certain software version and a certain product name, from one particular provider. |        |

| Name                        | Description   | Schema  |
|-----------------------------|---|---------|
| <b>detail</b> required      | A human-readable explanation specific to this occurrence of the problem.  | string  |
| <b>instance</b><br>optional | A URI reference that identifies the specific occurrence of<br>the problem. It may yield further information if<br>dereferenced.   |         |
| <b>status</b><br>required   | The HTTP status code for this occurrence of the problem. The HTTP status code ([RFC7231], Section 6) generated by the origin server for this occurrence of the problem.   | integer |
| <b>title</b><br>optional    | A short, human-readable summary of the problem type. It should not change from occurrence to occurrence of the problem, except for purposes of localization. If type is given and other than "about:blank", this attribute shall also be provided. A short, human-readable summary of the problem type. It SHOULD NOT change from occurrence to occurrence of the problem, except for purposes of localization (e.g., using proactive content negotiation; see [RFC7231], Section 3.4). | string  |
| <b>type</b> optional        | A URI reference according to IETF RFC 3986 [5] that identifies the problem type. It is encouraged that the URI provides human-readable documentation for the problem (e.g. using HTML) when dereferenced. When this member is not present, its value is assumed to be "about:blank".  |         |

| Name                      | Description   | Schema       |
|---------------------------|---|--------------|

# Read an individual subscription resource.

GET /subscriptions/{subscriptionId}

# Description

Query Subscription Information The GET method reads an individual subscription.

# **Parameters**

| Type   | Name                           | Description   | Schema |
|--------|--------------------------------|---|--------|
| Header | <b>Accept</b> required         | Content-Types that are acceptable for the response. Reference: IETF RFC 7231  | string |
| Header | <b>Authorization</b> optional  | The authorization token for the request. Reference: IETF RFC 7235.  | string |
| Header | <b>Version</b> required        | Version of the API requested to use when responding to this request.  | string |
| Path   | subscriptionI<br>d<br>required | Identifier of this subscription. This identifier can be retrieved from the resource referenced by the "Location" HTTP header in the response to a POST request creating a new subscription resource. It can also be retrieved from the "id" attribute in the payload body of that response. |        |

| HTTP<br>Code | Description  | Schema       |
|--------------|--|--------------|
| 200          | 200 OK Shall be returned when information about an individual subscription has been read successfully. The response body shall contain a representation of the subscription resource.  Headers:  Content-Type (string): The MIME type of the body of the response.  WWW-Authenticate (string): Challenge if the corresponding HTTP request has not provided authorization, or error details if the corresponding HTTP request has provided an invalid authorization token.  Version (string): Version of the API used in the response. | Response 200 |

| HTTP<br>Code | Description  | Schema       |
|--------------|--|--------------|
| 400          | 400 BAD REQUEST 400 code can be returned in the following specified cases, the specific cause has to be proper specified in the "ProblemDetails" structure to be returned. If the request is malformed or syntactically incorrect (e.g. if the request URI contains incorrect query parameters or the payload body contains a syntactically incorrect data structure), the API producer shall respond with this response code. The "ProblemDetails" structure shall be provided, and should include in the "detail" attribute more information about the source of the problem. If the response to a GET request which queries a container resource would be so big that the performance of the API producer is adversely affected, and the API producer does not support paging for the affected resource, it shall respond with this response code. The "ProblemDetails" structure shall be provided, and should include in the "detail" attribute more information about the source of the problem. If there is an application error related to the client's input that cannot be easily mapped to any other HTTP response code ("catch all error"), the API producer shall respond with this response code. The "ProblemDetails" structure shall be provided, and shall include in the "detail" attribute more information about the source of the problem. If the request contains a malformed access token, the API producer should respond with this response. The details of the error shall be returned in the WWW Authenticate HTTP header, as defined in IETF RFC 6750 and IETF RFC 7235. The ProblemDetails structure may be provided. The use of this HTTP error response code described above is applicable to the use of the OAuth 2.0 for the authorization of API requests and notifications, as defined in clauses 4.5.3.3 and 4.5.3.4.  Headers:  Content-Type (string): The MIME type of the body of the response.  WWW-Authenticate (string): Challenge if the corresponding HTTP request has not provided authorization, or error details if the corresponding HTTP request has provided an invalid auth | Response 400 |

| HTTP<br>Code | Description  | Schema       |
|--------------|--|--------------|
| 401          | 401 UNAUTHORIZED If the request contains no access token even though one is required, or if the request contains an authorization token that is invalid (e.g. expired or revoked), the API producer should respond with this response. The details of the error shall be returned in the WWW-Authenticate HTTP header, as defined in IETF RFC 6750 and IETF RFC 7235. The ProblemDetails structure may be provided.  Headers:  Content-Type (string): The MIME type of the body of the response.  WWW-Authenticate (string): Challenge if the corresponding HTTP request has not provided authorization, or error details if the corresponding HTTP request has provided an invalid authorization token.  Version (string): Version of the API used in the response. | Response 401 |
| 403          | 403 FORBIDDEN If the API consumer is not allowed to perform a particular request to a particular resource, the API producer shall respond with this response code. The "ProblemDetails" structure shall be provided. It should include in the "detail" attribute information about the source of the problem, and may indicate how to solve it.  Headers:  Content-Type (string): The MIME type of the body of the response.  WWW-Authenticate (string): Challenge if the corresponding HTTP request has not provided authorization, or error details if the corresponding HTTP request has provided an invalid authorization token.  Version (string): Version of the API used in the response.   | Response 403 |

| HTTP<br>Code | Description   | Schema       |
|--------------|---|--------------|
| 404          | 404 NOT FOUND If the API producer did not find a current representation for the resource addressed by the URI passed in the request or is not willing to disclose that one exists, it shall respond with this response code. The "ProblemDetails" structure may be provided, including in the "detail" attribute information about the source of the problem, e.g. a wrong resource URI variable. This response code is not appropriate in case the resource addressed by the URI is a container resource which is designed to contain child resources, but does not contain any child resource at the time the request is received. For a GET request to an existing empty container resource, a typical response contains a 200 OK response code and a payload body with an empty array.  Headers:  Content-Type (string): The MIME type of the body of the response.  WWW-Authenticate (string): Challenge if the corresponding HTTP request has not provided authorization, or error details if the corresponding HTTP request has provided an invalid authorization token.  Version (string): Version of the API used in the response. |              |
| 405          | 405 METHOD NOT ALLOWED If a particular HTTP method is not supported for a particular resource, the API producer shall respond with this response code. The "ProblemDetails" structure may be omitted.  Headers: Content-Type (string): The MIME type of the body of the response.  WWW-Authenticate (string): Challenge if the corresponding HTTP request has not provided authorization, or error details if the corresponding HTTP request has provided an invalid authorization token.  Version (string): Version of the API used in the response.   | Response 405 |
| 406          | 406 NOT ACCEPTABLE If the "Accept" header does not contain at least one name of a content type that is acceptable to the API producer, the API producer shall respond with this response code. The "ProblemDetails" structure may be omitted.  Headers:  Content-Type (string): The MIME type of the body of the response.  WWW-Authenticate (string): Challenge if the corresponding HTTP request has not provided authorization, or error details if the corresponding HTTP request has provided an invalid authorization token.  Version (string): Version of the API used in the response.  | Response 406 |

| HTTP<br>Code | Description   | Schema       |
|--------------|---|--------------|
| 416          | 416 RANGE NOT SATISFIABLE  Headers: Content-Type (string): The MIME type of the body of the response.  WWW-Authenticate (string): Challenge if the corresponding HTTP request has not provided authorization, or error details if the corresponding HTTP request has provided an invalid authorization token.  Version (string): Version of the API used in the response.   | Response 416 |
| 500          | 500 INTERNAL SERVER ERROR If there is an application error not related to the client's input that cannot be easily mapped to any other HTTP response code ("catch all error"), the API producer shall respond with this response code. The "ProblemDetails" structure shall be provided, and shall include in the "detail" attribute more information about the source of the problem.  Headers:  Content-Type (string): The MIME type of the body of the response.  WWW-Authenticate (string): Challenge if the corresponding HTTP request has not provided authorization, or error details if the corresponding HTTP request has provided an invalid authorization token.  Version (string): Version of the API used in the response. | Response 500 |
| 503          | 503 SERVICE UNAVAILABLE If the API producer encounters an internal overload situation of itself or of a system it relies on, it should respond with this response code, following the provisions in IETF RFC 7231 for the use of the "Retry-After" HTTP header and for the alternative to refuse the connection. The "ProblemDetails" structure may be omitted.  Headers:  Content-Type (string): The MIME type of the body of the response.  WWW-Authenticate (string): Challenge if the corresponding HTTP request has not provided authorization, or error details if the corresponding HTTP request has provided an invalid authorization token.  Version (string): Version of the API used in the response.                        | Response 503 |

| Name               | Description                                  | Schema |
|--------------------|--|--------|
| _links<br>required | Links to resources related to this resource. | _links |

| Name                           | Description  | Schema       |
|--------------------------------|--|--------------|
| <b>callbackUri</b><br>required | String formatted according to IETF RFC 3986.   | string (uri) |
| <b>filter</b><br>optional      | This type represents a subscription filter related to notifications related to VNF package management. At a particular nesting level in the filter structure, the following applies: All attributes shall match in order for the filter to match (logical "and" between different filter attributes). If an attribute is an array, the attribute shall match if at least one of the values in the array matches (logical "or" between the values of one filter attribute). | filter       |
| <b>id</b><br>required          | String formatted according to IETF RFC 3986.   | string (uri) |

#### \_links

| Name                 | Description                                | Schema |
|----------------------|--|--------|
| <b>self</b> required | This type represents a link to a resource. | self   |

## self

| Name                 | Description  | Schema |
|----------------------|--|--------|
| <b>href</b> required | URI of a resource referenced from a notification. Should be an absolute URI (i.e. a URI that contains {apiRoot}), however, may be a relative URI (i.e. a URI where the {apiRoot} part is omitted) if the {apiRoot} information is not available. |        |

#### filter

| Name                                     | Description  | Schema  |
|--|--|---|
| notificationTy pes optional              | Match particular notification types. Permitted values: -<br>VnfPackageOnboardingNotification -<br>VnfPackageChangeNotification | enum (VnfPackageOnboar dingNotification, VnfPackageChangeN otification) |
| vnfProductsFr<br>omProviders<br>optional | If present, match VNF packages that contain VNF products from certain providers.   | <pre>  vnfProductsFromPr   oviders &gt; array</pre>                     |

#### vnfProductsFromProviders

| Name                             | Description   | Schema                                    |
|----------------------------------|---|---|
| operationalSt<br>ate<br>optional | Match VNF packages with a package identifier listed in the attribute. May be present if the "notificationTypes" attribute contains the value "VnfPackageChangeNotification", and shall be absent otherwise. | < enum (ENABLED,<br>DISABLED) > array     |
| <b>usageState</b><br>optional    | Match particular usage state of the on-boarded VNF package. May be present if the "notificationTypes" attribute contains the value "VnfPackageChangeNotification", and shall be absent otherwise.           | < enum (IN_USE,<br>NOT_IN_USE) ><br>array |
| vnfPkgId<br>optional             | Match VNF packages with a package identifier listed in the attribute. May be present if the "notificationTypes" attribute contains the value "VnfPackageChangeNotification", and shall be absent otherwise. | < string > array                          |
| vnfProducts<br>optional          | If present, match VNF packages that contain VNF products with certain product names, from one particular provider.  | < vnfProducts > array                     |
| vnfProvider<br>required          | Name of the VNFprovider to match.   | string                                    |
| vnfdId<br>optional               | Match VNF packages with a VNFD identifier listed in the attribute.  | < string > array                          |

#### vnfProducts

| Name                           | Description  | Schema |
|--------------------------------|--|--------|
| versions<br>optional           | If present, match VNF packages that contain VNF products with certain versions and a certain product name, from one particular provider. |        |
| vnfProductNa<br>me<br>required | Name of the VNF product to match.  | string |

#### versions

| Name                               | Description   | Schema           |
|------------------------------------|---|------------------|
| vnfSoftwareV<br>ersion<br>required | A Version. Representation: string of variable length.   | string           |
| vnfdVersions<br>optional           | If present, match VNF packages that contain VNF products with certain VNFD versions, a certain software version and a certain product name, from one particular provider. | < string > array |

| Name                        | Description   | Schema  |
|-----------------------------|---|---------|
| <b>detail</b> required      | A human-readable explanation specific to this occurrence of the problem.  | string  |
| <b>instance</b><br>optional | A URI reference that identifies the specific occurrence of<br>the problem. It may yield further information if<br>dereferenced.   |         |
| <b>status</b><br>required   | The HTTP status code for this occurrence of the problem. The HTTP status code ([RFC7231], Section 6) generated by the origin server for this occurrence of the problem.   | integer |
| <b>title</b><br>optional    | A short, human-readable summary of the problem type. It should not change from occurrence to occurrence of the problem, except for purposes of localization. If type is given and other than "about:blank", this attribute shall also be provided. A short, human-readable summary of the problem type. It SHOULD NOT change from occurrence to occurrence of the problem, except for purposes of localization (e.g., using proactive content negotiation; see [RFC7231], Section 3.4). | string  |
| <b>type</b> optional        | A URI reference according to IETF RFC 3986 [5] that identifies the problem type. It is encouraged that the URI provides human-readable documentation for the problem (e.g. using HTML) when dereferenced. When this member is not present, its value is assumed to be "about:blank".  |         |

# Terminate a subscription.

DELETE /subscriptions/{subscriptionId}

#### **Description**

The DELETE method terminates an individual subscription. This method shall follow the provisions specified in the Tables 9.4.9.3.5-1 and 9.4.9.3.5-2 for URI query parameters, request and response data structures, and response codes. As the result of successfully executing this method, the "Individual subscription" resource shall not exist any longer. This means that no notifications for that subscription shall be sent to the formerly-subscribed API consumer. NOTE: Due to race conditions, some notifications might still be received by the formerly-subscribed API consumer for a certain time period after the deletion.

#### **Parameters**

| Туре   | Name                           | Description   | Schema |
|--------|--------------------------------|---|--------|
| Header | Authorization optional         | The authorization token for the request. Reference: IETF RFC 7235.  | string |
| Header | <b>Version</b> required        | Version of the API requested to use when responding to this request.  | string |
| Path   | subscriptionI<br>d<br>required | Identifier of this subscription. This identifier can be retrieved from the resource referenced by the "Location" HTTP header in the response to a POST request creating a new subscription resource. It can also be retrieved from the "id" attribute in the payload body of that response. | string |

| HTTP<br>Code | Description   | Schema     |
|--------------|---|------------|
| 204          | No Content Shall be returned when the subscription resource washas been deleted successfully.  Headers:  WWW-Authenticate (string): Challenge if the corresponding HTTP request has not provided authorization, or error details if the corresponding HTTP request has provided an invalid authorization token.  Version (string): Version of the API used in the response. | No Content |

| HTTP<br>Code | Description  | Schema       |
|--------------|--|--------------|
| 400          | 400 BAD REQUEST 400 code can be returned in the following specified cases, the specific cause has to be proper specified in the "ProblemDetails" structure to be returned. If the request is malformed or syntactically incorrect (e.g. if the request URI contains incorrect query parameters or the payload body contains a syntactically incorrect data structure), the API producer shall respond with this response code. The "ProblemDetails" structure shall be provided, and should include in the "detail" attribute more information about the source of the problem. If the response to a GET request which queries a container resource would be so big that the performance of the API producer is adversely affected, and the API producer does not support paging for the affected resource, it shall respond with this response code. The "ProblemDetails" structure shall be provided, and should include in the "detail" attribute more information about the source of the problem. If there is an application error related to the client's input that cannot be easily mapped to any other HTTP response code ("catch all error"), the API producer shall respond with this response code. The "ProblemDetails" structure shall be provided, and shall include in the "detail" attribute more information about the source of the problem. If the request contains a malformed access token, the API producer should respond with this response. The details of the error shall be returned in the WWW Authenticate HTTP header, as defined in IETF RFC 6750 and IETF RFC 7235. The ProblemDetails structure may be provided. The use of the OAuth 2.0 for the authorization of API requests and notifications, as defined in clauses 4.5.3.3 and 4.5.3.4.  Headers:  Content-Type (string): The MIME type of the body of the response.  WWW-Authenticate (string): Challenge if the corresponding HTTP request has not provided authorization, or error details if the corresponding HTTP request has provided an invalid authorization token. | Response 400 |

| HTTP<br>Code | Description  | Schema       |
|--------------|--|--------------|
| 401          | 401 UNAUTHORIZED If the request contains no access token even though one is required, or if the request contains an authorization token that is invalid (e.g. expired or revoked), the API producer should respond with this response. The details of the error shall be returned in the WWW-Authenticate HTTP header, as defined in IETF RFC 6750 and IETF RFC 7235. The ProblemDetails structure may be provided.  Headers:  Content-Type (string): The MIME type of the body of the response.  WWW-Authenticate (string): Challenge if the corresponding HTTP request has not provided authorization, or error details if the corresponding HTTP request has provided an invalid authorization token.  Version (string): Version of the API used in the response. | Response 401 |
| 403          | 403 FORBIDDEN If the API consumer is not allowed to perform a particular request to a particular resource, the API producer shall respond with this response code. The "ProblemDetails" structure shall be provided. It should include in the "detail" attribute information about the source of the problem, and may indicate how to solve it.  Headers:  Content-Type (string): The MIME type of the body of the response.  WWW-Authenticate (string): Challenge if the corresponding HTTP request has not provided authorization, or error details if the corresponding HTTP request has provided an invalid authorization token.  Version (string): Version of the API used in the response.   | Response 403 |

| HTTP<br>Code | Description   | Schema       |
|--------------|---|--------------|
| 404          | 404 NOT FOUND If the API producer did not find a current representation for the resource addressed by the URI passed in the request or is not willing to disclose that one exists, it shall respond with this response code. The "ProblemDetails" structure may be provided, including in the "detail" attribute information about the source of the problem, e.g. a wrong resource URI variable. This response code is not appropriate in case the resource addressed by the URI is a container resource which is designed to contain child resources, but does not contain any child resource at the time the request is received. For a GET request to an existing empty container resource, a typical response contains a 200 OK response code and a payload body with an empty array.  Headers:  Content-Type (string): The MIME type of the body of the response.  WWW-Authenticate (string): Challenge if the corresponding HTTP request has not provided authorization, or error details if the corresponding HTTP request has provided an invalid authorization token.  Version (string): Version of the API used in the response. |              |
| 405          | 405 METHOD NOT ALLOWED If a particular HTTP method is not supported for a particular resource, the API producer shall respond with this response code. The "ProblemDetails" structure may be omitted.  Headers: Content-Type (string): The MIME type of the body of the response.  WWW-Authenticate (string): Challenge if the corresponding HTTP request has not provided authorization, or error details if the corresponding HTTP request has provided an invalid authorization token.  Version (string): Version of the API used in the response.   | Response 405 |
| 406          | 406 NOT ACCEPTABLE If the "Accept" header does not contain at least one name of a content type that is acceptable to the API producer, the API producer shall respond with this response code. The "ProblemDetails" structure may be omitted.  Headers:  Content-Type (string): The MIME type of the body of the response.  WWW-Authenticate (string): Challenge if the corresponding HTTP request has not provided authorization, or error details if the corresponding HTTP request has provided an invalid authorization token.  Version (string): Version of the API used in the response.  | Response 406 |

| HTTP<br>Code | Description   | Schema       |
|--------------|---|--------------|
| 416          | 416 RANGE NOT SATISFIABLE  Headers: Content-Type (string): The MIME type of the body of the response.  WWW-Authenticate (string): Challenge if the corresponding HTTP request has not provided authorization, or error details if the corresponding HTTP request has provided an invalid authorization token.  Version (string): Version of the API used in the response.   | Response 416 |
| 500          | 500 INTERNAL SERVER ERROR If there is an application error not related to the client's input that cannot be easily mapped to any other HTTP response code ("catch all error"), the API producer shall respond with this response code. The "ProblemDetails" structure shall be provided, and shall include in the "detail" attribute more information about the source of the problem.  Headers:  Content-Type (string): The MIME type of the body of the response.  WWW-Authenticate (string): Challenge if the corresponding HTTP request has not provided authorization, or error details if the corresponding HTTP request has provided an invalid authorization token.  Version (string): Version of the API used in the response. | Response 500 |
| 503          | 503 SERVICE UNAVAILABLE If the API producer encounters an internal overload situation of itself or of a system it relies on, it should respond with this response code, following the provisions in IETF RFC 7231 for the use of the "Retry-After" HTTP header and for the alternative to refuse the connection. The "ProblemDetails" structure may be omitted.  Headers:  Content-Type (string): The MIME type of the body of the response.  WWW-Authenticate (string): Challenge if the corresponding HTTP request has not provided authorization, or error details if the corresponding HTTP request has provided an invalid authorization token.  Version (string): Version of the API used in the response.                        | Response 503 |

| Name                      | Description  | Schema |
|---------------------------|--|--------|

# Create a new individual VNF package resource.

POST /vnf\_packages

# **Description**

The POST method creates a new individual VNF package resource.

#### **Parameters**

| Type   | Name                          | Description  | Schema |
|--------|-------------------------------|--|--------|
| Header | <b>Accept</b> required        | Content-Types that are acceptable for the response. Reference: IETF RFC 7231 | string |
| Header | <b>Authorization</b> optional | The authorization token for the request. Reference: IETF RFC 7235.           | string |

| Туре   | Name                    | Description  | Schema |
|--------|-------------------------|--|--------|
| Header | Content-Type required   | The MIME type of the body of the request. Reference: IETF RFC 7231               | string |
| Header | <b>Version</b> required | Version of the API requested to use when responding to this request.             | string |
| Body   | <b>body</b><br>required | IndividualVNF package resource creation parameters, as defined in clause 9.5.2.2 | body   |

# body

| Name                            | Description   | Schema |
|---------------------------------|---|--------|
| userDefinedD<br>ata<br>optional | This type represents a list of key-value pairs. The order of the pairs in the list is not significant. In JSON, a set of key-value pairs is represented as an object. It shall comply with the provisions defined in clause 4 of IETF RFC 7159. | 1.     |

# Responses

| HTTP<br>Code | Description  | Schema       |
|--------------|--|--------------|
| 201          | 201 Created An individual VNF package resource has been created successfully. The response body shall contain a representation of the new individual VNF package resource, as defined in clause 9.5.2.4. The HTTP response shall include a "Location" HTTP header that contains the resource URI of the individual VNF package resource.  Headers:  Content-Type (string): The MIME type of the body of the response. This header field shall be present if the response has a non-empty message body.  WWW-Authenticate (string): Challenge if the corresponding HTTP request has not provided authorization, or error details if the corresponding HTTP request has provided an invalid authorization token.  Version (string): Version of the API used in the response. | Response 201 |

| Name               | Description                                  | Schema |
|--------------------|--|--------|
| _links<br>optional | Links to resources related to this resource. | _links |

| Name                                | Description   | Schema                           |
|-------------------------------------|---|----------------------------------|
| additionalArti<br>facts<br>optional | Information about VNF package artifacts contained in the VNF package that are not software images. This attribute shall not be present before the VNF package content is onboarded. Otherwise, this attribute shall be present if the VNF package contains additional artifacts.  | < additionalArtifacts<br>> array |
| checksum<br>optional                | This type represents the checksum of a VNF package or an artifact file.   | checksum                         |
| <b>id</b><br>required               | An identifier with the intention of being globally unique.  | string                           |
| onboardingSt<br>ate<br>required     | The enumeration PackageOnboardingStateType shall comply with the provisions defined in Table 9.5.4.3-1. Permitted values: - CREATED: The VNF package resource has been created UPLOADING: The associated VNF package content is being uploaded PROCESSING: The associated VNF package content is being processed, e.g. validation ONBOARDED: The associated VNF package content is successfully on-boarded. | UPLOADING,<br>PROCESSING,        |
| operationalSt<br>ate<br>required    | "The enumeration PackageOperationalStateType shall comply with the provisions defined in Table 9.5.4.4-1." Acceptable values are: - ENABLED - The VNF package is enabled, i.e. it can be used for instantiation of new VNF instances DISABLED - The VNF package is disabled, i.e. it cannot be used for further VNF instantiation requests (unless and until the VNF package is re-enabled).                | enum (ENABLED,<br>DISABLED)      |
| softwareImag<br>es<br>optional      | Information about VNF package artifacts that are software images. This attribute shall not be present before the VNF package content is on-boarded. Otherwise, this attribute shall be present unless it has been requested to be excluded per attribute selector.  | < softwareImages > array         |
| <b>usageState</b><br>required       | "The enumeration PackageUsageStateType shall comply with the provisions. Acceptable values are: -IN_USE - VNF instances instantiated from this VNF package existNOT_IN_USE - No existing VNF instance is instantiated from this VNF package"  | enum (IN_USE,<br>NOT_IN_USE)     |

| Name                               | Description   | Schema |
|------------------------------------|---|--------|
| userDefinedD<br>ata<br>optional    | This type represents a list of key-value pairs. The order of the pairs in the list is not significant. In JSON, a set of key-value pairs is represented as an object. It shall comply with the provisions defined in clause 4 of IETF RFC 7159. | object |
| vnfProductNa<br>me<br>optional     | Name to identify the VNF product.Invariant for the VNF product lifetime. This information is copied from the VNFD. It shall be present after the VNF package content has been on-boarded and absent otherwise.                                  | string |
| vnfProvider<br>optional            | Provider of the VNF package and the VNFD. This information is copied from the VNFD. It shall be present after the VNF package content has been on-boarded and absent otherwise.   | string |
| vnfSoftwareV<br>ersion<br>optional | A Version. Representation: string of variable length.   | string |
| vnfdId<br>optional                 | An identifier with the intention of being globally unique.  | string |
| vnfdVersion<br>optional            | A Version. Representation: string of variable length.   | string |

# \_links

| Name                           | Description                                | Schema         |
|--------------------------------|--|----------------|
| packageConte<br>nt<br>required | This type represents a link to a resource. | packageContent |
| <b>self</b> required           | This type represents a link to a resource. | self           |
| vnfd<br>optional               | This type represents a link to a resource. | vnfd           |

## packageContent

| Name                 | Description  | Schema       |
|----------------------|--|--------------|
| <b>href</b> required | URI of a resource referenced from a notification. Should be an absolute URI (i.e. a URI that contains {apiRoot}), however, may be a relative URI (i.e. a URI where the {apiRoot} part is omitted) if the {apiRoot} information is not available. | string (url) |

#### self

| Name                 | Description  | Schema       |
|----------------------|--|--------------|
| <b>href</b> required | URI of a resource referenced from a notification. Should be an absolute URI (i.e. a URI that contains {apiRoot}), however, may be a relative URI (i.e. a URI where the {apiRoot} part is omitted) if the {apiRoot} information is not available. | string (url) |

#### vnfd

| Name                 | Description  | Schema       |
|----------------------|--|--------------|
| <b>href</b> required | URI of a resource referenced from a notification. Should be an absolute URI (i.e. a URI that contains {apiRoot}), however, may be a relative URI (i.e. a URI where the {apiRoot} part is omitted) if the {apiRoot} information is not available. | string (url) |

#### additionalArtifacts

| Name                            | Description   | Schema   |
|---------------------------------|---|----------|
| <b>artifactPath</b><br>required | A string as defined in IETF RFC 8259.   | string   |
| checksum<br>required            | This type represents the checksum of a VNF package or an artifact file.   | checksum |
| metadata<br>optional            | This type represents a list of key-value pairs. The order of the pairs in the list is not significant. In JSON, a set of key-value pairs is represented as an object. It shall comply with the provisions defined in clause 4 of IETF RFC 7159. |          |

#### checksum

| Name                         | Description  | Schema |
|------------------------------|--|--------|
| <b>algorithm</b><br>required | Name of the algorithm used to generate the checksum, as defined in ETSI GS NFV-SOL 004 [5]. For example, SHA-256, SHA-512. | string |
| hash<br>required             | The hexadecimal value of the checksum.   | string |

#### checksum

| Name                         | Description  | Schema |
|------------------------------|--|--------|
| <b>algorithm</b><br>required | Name of the algorithm used to generate the checksum, as defined in ETSI GS NFV-SOL 004 [5]. For example, SHA-256, SHA-512. | string |
| hash<br>required             | The hexadecimal value of the checksum.   | string |

### softwareImages

| Name                            | Description  | Schema   |
|---------------------------------|--|--|
| checksum<br>required            | This type represents the checksum of a VNF package or an artifact file.  | checksum   |
| containerFor<br>mat<br>required | Container format indicates whether the software image is in a file format that also contains meta-data about the actual software. Permitted values: - AKI: a kernel image format - AMI: a machine image format - ARI: a ram disk image format - BARE: the image does not have a container or meta-data envelope - DOCKER: docker container format - OVA: OVF package in a tar file - OVF: OVF container format   | ARI, BARE, DOCKER,   |
| <b>diskFormat</b><br>required   | Disk format of a software image is the format of the underlying disk image. Permitted values: - AKI: a kernel image format - AMI: a machine image format - ARI: a ramdisk image format - ISO: an archive format for the data contents of an optical disc, such as CD-ROM - QCOW2: a common disk image format, which can expand dynamically and supports copy on write - RAW: an unstructured disk image format - VDI: a common disk image format - VHD: a common disk image format - VHDX: enhanced version of VHD format - VMDK: a common disk image format | enum (AKI, AMI,<br>ARI, ISO, QCOW2,<br>RAW, VDI, VHD,<br>VHDX, VMDK) |

| Name                     | Description   | Schema  |
|--------------------------|---|---------|
| <b>id</b><br>required    | Identifier of the VNF Virtual Link Descriptor (VLD) in the VNFD.  | string  |
| imagePath<br>required    | Path in the VNF package, which identifies the image artifact and also allows to access a copy of the image artifact.  | string  |
| minDisk<br>required      | The minimal disk for this software image in bytes.  Minimum value: 0  | integer |
| minRam<br>required       | The minimal RAM for this software image in bytes.  Minimum value: 0   | integer |
| name<br>required         | Name of the software image.   | string  |
| <b>provider</b> required | Provider of the software image.   | string  |
| size<br>required         | Size of this software image in bytes.  Minimum value: 0   | integer |
| userMetadata<br>optional | This type represents a list of key-value pairs. The order of the pairs in the list is not significant. In JSON, a set of key-value pairs is represented as an object. It shall comply with the provisions defined in clause 4 of IETF RFC 7159. | object  |
| version<br>required      | A Version. Representation: string of variable length.   | string  |

#### checksum

| Name                         | Description  | Schema |
|------------------------------|--|--------|
| <b>algorithm</b><br>required | Name of the algorithm used to generate the checksum, as defined in ETSI GS NFV-SOL 004 [5]. For example, SHA-256, SHA-512. | string |
| hash<br>required             | The hexadecimal value of the checksum.   | string |

# Query VNF packages information.

# **Description**

The GET method queries the information of the VNF packages matching the filter. This method shall follow the provisions specified in the Tables 9.4.2.3.2-1 and 9.4.2.3.2-2 for URI query parameters, request and response data structures, and response codes.

#### **Parameters**

| Туре   | Name                            | Description   | Schema |
|--------|---------------------------------|---|--------|
| Header | <b>Accept</b> required          | Content-Types that are acceptable for the response. Reference: IETF RFC 7231  | string |
| Header | Authorization optional          | The authorization token for the request. Reference: IETF RFC 7235.  | string |
| Header | <b>Version</b> required         | Version of the API requested to use when responding to this request.  | string |
| Query  | all_fields<br>optional          | Include all complex attributes in the response.<br>See clause 5.3 of ETSI GS NFV SOL 013 for<br>details. The NFVO shall support this parameter.   | string |
| Query  | exclude_defau<br>lt<br>optional | Indicates to exclude the following complex attributes from the response. See clause 5.3 of ETSI GS NFV-SOL 013 for details. The NFVO shall support this parameter. The following attributes shall be excluded from the VnfPkgInfo structure in the response body if this parameter is provided, or none of the parameters "all_fields," "fields", "exclude_fields", "exclude_default" are provided: - softwareImages - additionalArtifacts - userDefinedData - checksum |        |
| Query  | exclude_fields optional         | Complex attributes to be excluded from the response. See clause 5.3 of ETSI GS NFV SOL 013 for details. The NFVO should support this parameter.   | string |
| Query  | <b>fields</b> optional          | Complex attributes to be included into the response. See clause 5.3 of ETSI GS NFV SOL 013 for details. The NFVO should support this parameter.   | string |

| Туре  | Name                                   | Description  | Schema |
|-------|--|--|--------|
| Query | <b>filter</b><br>optional              | Attribute-based filtering expression according to clause 5.2 of ETSI GS NFV SOL 013. The NFVO shall support receiving this parameter as part of the URI query string. The OSS/BSS may supply this parameter. All attribute names that appear in the VnfPkgInfo and in data types referenced from it shall be supported by the NFVO in the filter expression. |        |
| Query | nextpage_opa<br>que_marker<br>optional | Marker to obtain the next page of a paged response. Shall be supported by the NFVO if the NFVO supports alternative 2 (paging) according to clause 5.4.2.1 of ETSI GS NFV SOL 013 for this resource.   | string |

| HTTP<br>Code | Description   | Schema                 |
|--------------|---|------------------------|
| 200          | 200 OK Shall be returned when information about zero or more VNF packages has been queried successfully. The response body shall contain in an array the VNF package info representations that match the attribute filter, i.e. zero or more VNF package info representations as defined in clause 9.5.2.5. If the "filter" URI parameter or one of the "all_fields", "fields", "exclude_fields" or "exclude_default" URI parameters was supplied in the request and is supported, the data in the response body shall have been transformed according to the rules specified in clauses 5.2.2 and 5.3.2 of ETSI GS NFV SOL 013, respectively. If the NFVO supports alternative 2 (paging) according to clause 5.4.2.1 of ETSI GS NFV SOL 013 for this resource, inclusion of the Link HTTP header in this response shall follow the provisions in clause 5.4.2.3 of ETSI GS NFV SOL 013.  Headers:  Content-Type (string): The MIME type of the body of the response.  WW-Authenticate (string): Challenge if the corresponding HTTP request has not provided authorization, or error details if the corresponding HTTP request has provided an invalid authorization token.  Version (string): Version of the API used in the response. | < Response 200 > array |

| HTTP<br>Code | Description  | Schema       |
|--------------|--|--------------|
| 400          | 400 BAD REQUEST 400 code can be returned in the following specified cases, the specific cause has to be proper specified in the "ProblemDetails" structure to be returned. If the request is malformed or syntactically incorrect (e.g. if the request URI contains incorrect query parameters or the payload body contains a syntactically incorrect data structure), the API producer shall respond with this response code. The "ProblemDetails" structure shall be provided, and should include in the "detail" attribute more information about the source of the problem. If the response to a GET request which queries a container resource would be so big that the performance of the API producer is adversely affected, and the API producer does not support paging for the affected resource, it shall respond with this response code. The "ProblemDetails" structure shall be provided, and should include in the "detail" attribute more information about the source of the problem. If there is an application error related to the client's input that cannot be easily mapped to any other HTTP response code ("catch all error"), the API producer shall respond with this response code. The "ProblemDetails" structure shall be provided, and shall include in the "detail" attribute more information about the source of the problem. If the request contains a malformed access token, the API producer should respond with this response. The details of the error shall be returned in the WWW Authenticate HTTP header, as defined in IETF RFC 6750 and IETF RFC 7235. The ProblemDetails structure may be provided. The use of this HTTP error response code described above is applicable to the use of the OAuth 2.0 for the authorization of API requests and notifications, as defined in clauses 4.5.3.3 and 4.5.3.4.  Headers:  Content-Type (string): The MIME type of the body of the response.  WWW-Authenticate (string): Challenge if the corresponding HTTP request has not provided authorization, or error details if the corresponding HTTP request has provided an invalid auth | Response 400 |

| HTTP<br>Code | Description  | Schema       |
|--------------|--|--------------|
| 401          | 401 UNAUTHORIZED If the request contains no access token even though one is required, or if the request contains an authorization token that is invalid (e.g. expired or revoked), the API producer should respond with this response. The details of the error shall be returned in the WWW-Authenticate HTTP header, as defined in IETF RFC 6750 and IETF RFC 7235. The ProblemDetails structure may be provided.  Headers:  Content-Type (string): The MIME type of the body of the response.  WWW-Authenticate (string): Challenge if the corresponding HTTP request has not provided authorization, or error details if the corresponding HTTP request has provided an invalid authorization token.  Version (string): Version of the API used in the response. | Response 401 |
| 403          | 403 FORBIDDEN If the API consumer is not allowed to perform a particular request to a particular resource, the API producer shall respond with this response code. The "ProblemDetails" structure shall be provided. It should include in the "detail" attribute information about the source of the problem, and may indicate how to solve it.  Headers:  Content-Type (string): The MIME type of the body of the response.  WWW-Authenticate (string): Challenge if the corresponding HTTP request has not provided authorization, or error details if the corresponding HTTP request has provided an invalid authorization token.  Version (string): Version of the API used in the response.   | Response 403 |

| HTTP<br>Code | Description   | Schema       |
|--------------|---|--------------|
| 404          | 404 NOT FOUND If the API producer did not find a current representation for the resource addressed by the URI passed in the request or is not willing to disclose that one exists, it shall respond with this response code. The "ProblemDetails" structure may be provided, including in the "detail" attribute information about the source of the problem, e.g. a wrong resource URI variable. This response code is not appropriate in case the resource addressed by the URI is a container resource which is designed to contain child resources, but does not contain any child resource at the time the request is received. For a GET request to an existing empty container resource, a typical response contains a 200 OK response code and a payload body with an empty array.  Headers:  Content-Type (string): The MIME type of the body of the response.  WWW-Authenticate (string): Challenge if the corresponding HTTP request has not provided authorization, or error details if the corresponding HTTP request has provided an invalid authorization token.  Version (string): Version of the API used in the response. | Response 404 |
| 405          | 405 METHOD NOT ALLOWED If a particular HTTP method is not supported for a particular resource, the API producer shall respond with this response code. The "ProblemDetails" structure may be omitted.  Headers: Content-Type (string): The MIME type of the body of the response.  WWW-Authenticate (string): Challenge if the corresponding HTTP request has not provided authorization, or error details if the corresponding HTTP request has provided an invalid authorization token.  Version (string): Version of the API used in the response.   | Response 405 |
| 406          | 406 NOT ACCEPTABLE If the "Accept" header does not contain at least one name of a content type that is acceptable to the API producer, the API producer shall respond with this response code. The "ProblemDetails" structure may be omitted.  Headers:  Content-Type (string): The MIME type of the body of the response.  WWW-Authenticate (string): Challenge if the corresponding HTTP request has not provided authorization, or error details if the corresponding HTTP request has provided an invalid authorization token.  Version (string): Version of the API used in the response.  | Response 406 |

| HTTP<br>Code | Description   | Schema       |
|--------------|---|--------------|
| 416          | 416 RANGE NOT SATISFIABLE  Headers: Content-Type (string): The MIME type of the body of the response.  WWW-Authenticate (string): Challenge if the corresponding HTTP request has not provided authorization, or error details if the corresponding HTTP request has provided an invalid authorization token.  Version (string): Version of the API used in the response.   | Response 416 |
| 500          | 500 INTERNAL SERVER ERROR If there is an application error not related to the client's input that cannot be easily mapped to any other HTTP response code ("catch all error"), the API producer shall respond with this response code. The "ProblemDetails" structure shall be provided, and shall include in the "detail" attribute more information about the source of the problem.  Headers:  Content-Type (string): The MIME type of the body of the response.  WWW-Authenticate (string): Challenge if the corresponding HTTP request has not provided authorization, or error details if the corresponding HTTP request has provided an invalid authorization token.  Version (string): Version of the API used in the response. | Response 500 |
| 503          | 503 SERVICE UNAVAILABLE If the API producer encounters an internal overload situation of itself or of a system it relies on, it should respond with this response code, following the provisions in IETF RFC 7231 for the use of the "Retry-After" HTTP header and for the alternative to refuse the connection. The "ProblemDetails" structure may be omitted.  Headers:  Content-Type (string): The MIME type of the body of the response.  WWW-Authenticate (string): Challenge if the corresponding HTTP request has not provided authorization, or error details if the corresponding HTTP request has provided an invalid authorization token.  Version (string): Version of the API used in the response.                        | Response 503 |

| VnfPkgInfo<br>optional | VnfPkgInfo |

## VnfPkgInfo

| Name                                | Description   | Schema                           |
|-------------------------------------|---|----------------------------------|
| _links optional                     | Links to resources related to this resource.  | _links                           |
| additionalArti<br>facts<br>optional | Information about VNF package artifacts contained in the VNF package that are not software images. This attribute shall not be present before the VNF package content is onboarded. Otherwise, this attribute shall be present if the VNF package contains additional artifacts.  | < additionalArtifacts<br>> array |
| checksum<br>optional                | This type represents the checksum of a VNF package or an artifact file.   | checksum                         |
| <b>id</b><br>required               | An identifier with the intention of being globally unique.  | string                           |
| onboardingSt<br>ate<br>required     | The enumeration PackageOnboardingStateType shall comply with the provisions defined in Table 9.5.4.3-1. Permitted values: - CREATED: The VNF package resource has been created UPLOADING: The associated VNF package content is being uploaded PROCESSING: The associated VNF package content is being processed, e.g. validation ONBOARDED: The associated VNF package content is successfully on-boarded. | UPLOADING,<br>PROCESSING,        |
| operationalSt<br>ate<br>required    | "The enumeration PackageOperationalStateType shall comply with the provisions defined in Table 9.5.4.4-1." Acceptable values are: - ENABLED - The VNF package is enabled, i.e. it can be used for instantiation of new VNF instances DISABLED - The VNF package is disabled, i.e. it cannot be used for further VNF instantiation requests (unless and until the VNF package is re-enabled).                | enum (ENABLED,<br>DISABLED)      |
| softwareImag<br>es<br>optional      | Information about VNF package artifacts that are software images. This attribute shall not be present before the VNF package content is on-boarded. Otherwise, this attribute shall be present unless it has been requested to be excluded per attribute selector.  | < softwareImages > array         |

| Name                               | Description   | Schema                       |
|------------------------------------|---|------------------------------|
| <b>usageState</b><br>required      | "The enumeration PackageUsageStateType shall comply with the provisions. Acceptable values are: -IN_USE - VNF instances instantiated from this VNF package existNOT_IN_USE - No existing VNF instance is instantiated from this VNF package"    | enum (IN_USE,<br>NOT_IN_USE) |
| userDefinedD<br>ata<br>optional    | This type represents a list of key-value pairs. The order of the pairs in the list is not significant. In JSON, a set of key-value pairs is represented as an object. It shall comply with the provisions defined in clause 4 of IETF RFC 7159. | object                       |
| vnfProductNa<br>me<br>optional     | Name to identify the VNF product.Invariant for the VNF product lifetime. This information is copied from the VNFD. It shall be present after the VNF package content has been on-boarded and absent otherwise.                                  | string                       |
| vnfProvider<br>optional            | Provider of the VNF package and the VNFD. This information is copied from the VNFD. It shall be present after the VNF package content has been on-boarded and absent otherwise.   | string                       |
| vnfSoftwareV<br>ersion<br>optional | A Version. Representation: string of variable length.   | string                       |
| vnfdId<br>optional                 | An identifier with the intention of being globally unique.  | string                       |
| vnfdVersion<br>optional            | A Version. Representation: string of variable length.   | string                       |

|--------------------------------|--|----------------|
| packageConte<br>nt<br>required | This type represents a link to a resource. | packageContent |
| <b>self</b> required           | This type represents a link to a resource. | self           |
| vnfd<br>optional               | This type represents a link to a resource. | vnfd           |

## package Content

| Name                 | Description  | Schema       |
|----------------------|--|--------------|
| <b>href</b> required | URI of a resource referenced from a notification. Should be an absolute URI (i.e. a URI that contains {apiRoot}), however, may be a relative URI (i.e. a URI where the {apiRoot} part is omitted) if the {apiRoot} information is not available. | string (url) |

#### self

| Name                 | Description  | Schema       |
|----------------------|--|--------------|
| <b>href</b> required | URI of a resource referenced from a notification. Should be an absolute URI (i.e. a URI that contains {apiRoot}), however, may be a relative URI (i.e. a URI where the {apiRoot} part is omitted) if the {apiRoot} information is not available. | string (url) |

#### vnfd

| Name                 | Description  | Schema |
|----------------------|--|--------|
| <b>href</b> required | URI of a resource referenced from a notification. Should be an absolute URI (i.e. a URI that contains {apiRoot}), however, may be a relative URI (i.e. a URI where the {apiRoot} part is omitted) if the {apiRoot} information is not available. |        |

#### additionalArtifacts

| Name                         | Description   | Schema   |
|------------------------------|---|----------|
| <b>artifactPath</b> required | A string as defined in IETF RFC 8259.   | string   |
| checksum<br>required         | This type represents the checksum of a VNF package or an artifact file.   | checksum |
| metadata<br>optional         | This type represents a list of key-value pairs. The order of the pairs in the list is not significant. In JSON, a set of key-value pairs is represented as an object. It shall comply with the provisions defined in clause 4 of IETF RFC 7159. | object   |

#### checksum

| Name                         | Description  | Schema |
|------------------------------|--|--------|
| <b>algorithm</b><br>required | Name of the algorithm used to generate the checksum, as defined in ETSI GS NFV-SOL 004 [5]. For example, SHA-256, SHA-512. |        |
| <b>hash</b><br>required      | The hexadecimal value of the checksum.   | string |

#### checksum

| Name                         | Description  | Schema |
|------------------------------|--|--------|
| <b>algorithm</b><br>required | Name of the algorithm used to generate the checksum, as defined in ETSI GS NFV-SOL 004 [5]. For example, SHA-256, SHA-512. | string |
| <b>hash</b><br>required      | The hexadecimal value of the checksum.   | string |

### software Images

| Name                            | Description  | Schema  |
|---------------------------------|--|---|
| checksum<br>required            | This type represents the checksum of a VNF package or an artifact file.  | checksum  |
| containerFor<br>mat<br>required | Container format indicates whether the software image is in a file format that also contains meta-data about the actual software. Permitted values: - AKI: a kernel image format - AMI: a machine image format - ARI: a ram disk image format - BARE: the image does not have a container or meta-data envelope - DOCKER: docker container format - OVA: OVF package in a tar file - OVF: OVF container format   | ARI, BARE, DOCKER,                                |
| <b>diskFormat</b><br>required   | Disk format of a software image is the format of the underlying disk image. Permitted values: - AKI: a kernel image format - AMI: a machine image format - ARI: a ramdisk image format - ISO: an archive format for the data contents of an optical disc, such as CD-ROM - QCOW2: a common disk image format, which can expand dynamically and supports copy on write - RAW: an unstructured disk image format - VDI: a common disk image format - VHD: a common disk image format - VHDX: enhanced version of VHD format - VMDK: a common disk image format | ARI, ISO, QCOW2,<br>RAW, VDI, VHD,<br>VHDX, VMDK) |

| Name                     | Description   | Schema  |
|--------------------------|---|---------|
| <b>id</b><br>required    | Identifier of the VNF Virtual Link Descriptor (VLD) in the VNFD.  | string  |
| imagePath<br>required    | Path in the VNF package, which identifies the image artifact and also allows to access a copy of the image artifact.  | string  |
| minDisk<br>required      | The minimal disk for this software image in bytes.  Minimum value: 0  | integer |
| minRam<br>required       | The minimal RAM for this software image in bytes.  Minimum value: 0   | integer |
| <b>name</b><br>required  | Name of the software image.   | string  |
| <b>provider</b> required | Provider of the software image.   | string  |
| <b>size</b><br>required  | Size of this software image in bytes.  Minimum value: 0   | integer |
| userMetadata<br>optional | This type represents a list of key-value pairs. The order of the pairs in the list is not significant. In JSON, a set of key-value pairs is represented as an object. It shall comply with the provisions defined in clause 4 of IETF RFC 7159. | object  |
| version<br>required      | A Version. Representation: string of variable length.   | string  |

#### checksum

| Name                         | Description  | Schema |
|------------------------------|--|--------|
| <b>algorithm</b><br>required | Name of the algorithm used to generate the checksum, as defined in ETSI GS NFV-SOL 004 [5]. For example, SHA-256, SHA-512. | string |
| hash<br>required             | The hexadecimal value of the checksum.   | string |

| Name                      | Description   | Schema       |
|---------------------------|---|--------------|
| <b>detail</b><br>required | A human-readable explanation specific to this occurrence of the problem.  | string       |
| instance<br>optional      | A URI reference that identifies the specific occurrence of<br>the problem. It may yield further information if<br>dereferenced.   |              |
| status<br>required        | The HTTP status code for this occurrence of the problem. The HTTP status code ([RFC7231], Section 6) generated by the origin server for this occurrence of the problem.   | integer      |
| <b>title</b><br>optional  | A short, human-readable summary of the problem type. It should not change from occurrence to occurrence of the problem, except for purposes of localization. If type is given and other than "about:blank", this attribute shall also be provided. A short, human-readable summary of the problem type. It SHOULD NOT change from occurrence to occurrence of the problem, except for purposes of localization (e.g., using proactive content negotiation; see [RFC7231], Section 3.4). |              |
| <b>type</b><br>optional   | A URI reference according to IETF RFC 3986 [5] that identifies the problem type. It is encouraged that the URI provides human-readable documentation for the problem (e.g. using HTML) when dereferenced. When this member is not present, its value is assumed to be "about:blank".  | string (URI) |

| Name                      | Description   | Schema  |
|---------------------------|---|---------|
| <b>detail</b><br>required | A human-readable explanation specific to this occurrence of the problem.  | string  |
| instance<br>optional      | A URI reference that identifies the specific occurrence of<br>the problem. It may yield further information if<br>dereferenced.   |         |

| Name                     | Description   | Schema       |
|--------------------------|---|--------------|
| instance<br>optional     | A URI reference that identifies the specific occurrence of<br>the problem. It may yield further information if<br>dereferenced.   |              |
| status<br>required       | The HTTP status code for this occurrence of the problem. The HTTP status code ([RFC7231], Section 6) generated by the origin server for this occurrence of the problem.   | integer      |
| <b>title</b><br>optional | A short, human-readable summary of the problem type. It should not change from occurrence to occurrence of the problem, except for purposes of localization. If type is given and other than "about:blank", this attribute shall also be provided. A short, human-readable summary of the problem type. It SHOULD NOT change from occurrence to occurrence of the problem, except for purposes of localization (e.g., using proactive content negotiation; see [RFC7231], Section 3.4). |              |
| <b>type</b><br>optional  | A URI reference according to IETF RFC 3986 [5] that identifies the problem type. It is encouraged that the URI provides human-readable documentation for the problem (e.g. using HTML) when dereferenced. When this member is not present, its value is assumed to be "about:blank".  | string (URI) |

# Read information about an individual VNF package.

GET /vnf\_packages/{vnfPkgId}

# **Description**

The GET method reads the information of a VNF package.

#### **Parameters**

| Type   | Name                          | Description  | Schema |
|--------|-------------------------------|--|--------|
| Header | <b>Accept</b> required        | Content-Types that are acceptable for the response. Reference: IETF RFC 7231 | string |
| Header | <b>Authorization</b> optional | The authorization token for the request. Reference: IETF RFC 7235.           | string |

| Type   | Name                    | Description   | Schema |
|--------|-------------------------|---|--------|
| Header | <b>Version</b> required | Version of the API requested to use when responding to this request.    | string |
| Path   | vnfPkgId<br>required    | Identifier of the VNF package. The identifier is allocated by the NFVO. | string |

| HTTP<br>Code | Description   | Schema       |
|--------------|---|--------------|
| 200          | 200 OK Shall be returned when information of the VNF package has been read successfully. The response body shall contain the VNF package info representation defined in clause 9.5.2.5.  Headers:  Content-Type (string): The MIME type of the body of the response. This header field shall be present if the response has a non-empty message body.  WWW-Authenticate (string): Challenge if the corresponding HTTP request has not provided authorization, or error details if the corresponding HTTP request has provided an invalid authorization token.  Version (string): Version of the API used in the response. | Response 200 |

| HTTP<br>Code | Description   | Schema       |
|--------------|---|--------------|
| 400          | 400 BAD REQUEST 400 code can be returned in the following specified cases, the specific cause has to be proper specified in the "ProblemDetails" structure to be returned. If the request is malformed or syntactically incorrect (e.g. if the request URI contains incorrect query parameters or the payload body contains a syntactically incorrect data structure), the API producer shall respond with this response code. The "ProblemDetails" structure shall be provided, and should include in the "detail" attribute more information about the source of the problem. If the response to a GET request which queries a container resource would be so big that the performance of the API producer is adversely affected, and the API producer does not support paging for the affected resource, it shall respond with this response code. The "ProblemDetails" structure shall be provided, and should include in the "detail" attribute more information about the source of the problem. If there is an application error related to the client's input that cannot be easily mapped to any other HTTP response code ("catch all error"), the API producer shall respond with this response code. The "ProblemDetails" structure shall be provided, and shall include in the "detail" attribute more information about the source of the problem. If the request contains a malformed access token, the API producer should respond with this response. The details of the error shall be returned in the WWW Authenticate HTTP header, as defined in IETF RFC 6750 and IETF RFC 7235. The ProblemDetails structure may be provided. The use of the OAuth 2.0 for the authorization of API requests and notifications, as defined in clauses 4.5.3.3 and 4.5.3.4.  Headers:  Content-Type (string): The MIME type of the body of the response.  WWW-Authenticate (string): Challenge if the corresponding HTTP request has not provided authorization, or error details if the corresponding HTTP request has provided authorization invalid authorization token. | Response 400 |

| HTTP<br>Code | Description  | Schema       |
|--------------|--|--------------|
| 401          | 401 UNAUTHORIZED If the request contains no access token even though one is required, or if the request contains an authorization token that is invalid (e.g. expired or revoked), the API producer should respond with this response. The details of the error shall be returned in the WWW-Authenticate HTTP header, as defined in IETF RFC 6750 and IETF RFC 7235. The ProblemDetails structure may be provided.  Headers:  Content-Type (string): The MIME type of the body of the response.  WWW-Authenticate (string): Challenge if the corresponding HTTP request has not provided authorization, or error details if the corresponding HTTP request has provided an invalid authorization token.  Version (string): Version of the API used in the response. | Response 401 |
| 403          | 403 FORBIDDEN If the API consumer is not allowed to perform a particular request to a particular resource, the API producer shall respond with this response code. The "ProblemDetails" structure shall be provided. It should include in the "detail" attribute information about the source of the problem, and may indicate how to solve it.  Headers:  Content-Type (string): The MIME type of the body of the response.  WWW-Authenticate (string): Challenge if the corresponding HTTP request has not provided authorization, or error details if the corresponding HTTP request has provided an invalid authorization token.  Version (string): Version of the API used in the response.   | Response 403 |

| HTTP<br>Code | Description   | Schema       |
|--------------|---|--------------|
| 404          | 404 NOT FOUND If the API producer did not find a current representation for the resource addressed by the URI passed in the request or is not willing to disclose that one exists, it shall respond with this response code. The "ProblemDetails" structure may be provided, including in the "detail" attribute information about the source of the problem, e.g. a wrong resource URI variable. This response code is not appropriate in case the resource addressed by the URI is a container resource which is designed to contain child resources, but does not contain any child resource at the time the request is received. For a GET request to an existing empty container resource, a typical response contains a 200 OK response code and a payload body with an empty array.  Headers:  Content-Type (string): The MIME type of the body of the response.  WWW-Authenticate (string): Challenge if the corresponding HTTP request has not provided authorization, or error details if the corresponding HTTP request has provided an invalid authorization token.  Version (string): Version of the API used in the response. |              |
| 405          | 405 METHOD NOT ALLOWED If a particular HTTP method is not supported for a particular resource, the API producer shall respond with this response code. The "ProblemDetails" structure may be omitted.  Headers: Content-Type (string): The MIME type of the body of the response.  WWW-Authenticate (string): Challenge if the corresponding HTTP request has not provided authorization, or error details if the corresponding HTTP request has provided an invalid authorization token.  Version (string): Version of the API used in the response.   | Response 405 |
| 406          | 406 NOT ACCEPTABLE If the "Accept" header does not contain at least one name of a content type that is acceptable to the API producer, the API producer shall respond with this response code. The "ProblemDetails" structure may be omitted.  Headers:  Content-Type (string): The MIME type of the body of the response.  WWW-Authenticate (string): Challenge if the corresponding HTTP request has not provided authorization, or error details if the corresponding HTTP request has provided an invalid authorization token.  Version (string): Version of the API used in the response.  | Response 406 |

| HTTP<br>Code | Description   | Schema       |
|--------------|---|--------------|
| 416          | 416 RANGE NOT SATISFIABLE  Headers: Content-Type (string): The MIME type of the body of the response.  WWW-Authenticate (string): Challenge if the corresponding HTTP request has not provided authorization, or error details if the corresponding HTTP request has provided an invalid authorization token.  Version (string): Version of the API used in the response.   | Response 416 |
| 500          | 500 INTERNAL SERVER ERROR If there is an application error not related to the client's input that cannot be easily mapped to any other HTTP response code ("catch all error"), the API producer shall respond with this response code. The "ProblemDetails" structure shall be provided, and shall include in the "detail" attribute more information about the source of the problem.  Headers:  Content-Type (string): The MIME type of the body of the response.  WWW-Authenticate (string): Challenge if the corresponding HTTP request has not provided authorization, or error details if the corresponding HTTP request has provided an invalid authorization token.  Version (string): Version of the API used in the response. | Response 500 |
| 503          | 503 SERVICE UNAVAILABLE If the API producer encounters an internal overload situation of itself or of a system it relies on, it should respond with this response code, following the provisions in IETF RFC 7231 for the use of the "Retry-After" HTTP header and for the alternative to refuse the connection. The "ProblemDetails" structure may be omitted.  Headers:  Content-Type (string): The MIME type of the body of the response.  WWW-Authenticate (string): Challenge if the corresponding HTTP request has not provided authorization, or error details if the corresponding HTTP request has provided an invalid authorization token.  Version (string): Version of the API used in the response.                        | Response 503 |

| Name               | Description                                  | Schema |
|--------------------|--|--------|
| _links<br>optional | Links to resources related to this resource. | _links |

| Name                                | Description   | Schema                           |
|-------------------------------------|---|----------------------------------|
| additionalArti<br>facts<br>optional | Information about VNF package artifacts contained in the VNF package that are not software images. This attribute shall not be present before the VNF package content is onboarded. Otherwise, this attribute shall be present if the VNF package contains additional artifacts.  | < additionalArtifacts<br>> array |
| checksum<br>optional                | This type represents the checksum of a VNF package or an artifact file.   | checksum                         |
| <b>id</b><br>required               | An identifier with the intention of being globally unique.  | string                           |
| onboardingSt<br>ate<br>required     | The enumeration PackageOnboardingStateType shall comply with the provisions defined in Table 9.5.4.3-1. Permitted values: - CREATED: The VNF package resource has been created UPLOADING: The associated VNF package content is being uploaded PROCESSING: The associated VNF package content is being processed, e.g. validation ONBOARDED: The associated VNF package content is successfully on-boarded. | UPLOADING,<br>PROCESSING,        |
| operationalSt<br>ate<br>required    | "The enumeration PackageOperationalStateType shall comply with the provisions defined in Table 9.5.4.4-1." Acceptable values are: - ENABLED - The VNF package is enabled, i.e. it can be used for instantiation of new VNF instances DISABLED - The VNF package is disabled, i.e. it cannot be used for further VNF instantiation requests (unless and until the VNF package is re-enabled).                | enum (ENABLED,<br>DISABLED)      |
| softwareImag<br>es<br>optional      | Information about VNF package artifacts that are software images. This attribute shall not be present before the VNF package content is on-boarded. Otherwise, this attribute shall be present unless it has been requested to be excluded per attribute selector.  | < softwareImages > array         |
| <b>usageState</b><br>required       | "The enumeration PackageUsageStateType shall comply with the provisions. Acceptable values are: -IN_USE - VNF instances instantiated from this VNF package existNOT_IN_USE - No existing VNF instance is instantiated from this VNF package"  | enum (IN_USE,<br>NOT_IN_USE)     |

| Name                               | Description   | Schema |
|------------------------------------|---|--------|
| userDefinedD<br>ata<br>optional    | This type represents a list of key-value pairs. The order of the pairs in the list is not significant. In JSON, a set of key-value pairs is represented as an object. It shall comply with the provisions defined in clause 4 of IETF RFC 7159. | object |
| vnfProductNa<br>me<br>optional     | Name to identify the VNF product.Invariant for the VNF product lifetime. This information is copied from the VNFD. It shall be present after the VNF package content has been on-boarded and absent otherwise.                                  | string |
| vnfProvider<br>optional            | Provider of the VNF package and the VNFD. This information is copied from the VNFD. It shall be present after the VNF package content has been on-boarded and absent otherwise.   | string |
| vnfSoftwareV<br>ersion<br>optional | A Version. Representation: string of variable length.   | string |
| vnfdId<br>optional                 | An identifier with the intention of being globally unique.  | string |
| vnfdVersion<br>optional            | A Version. Representation: string of variable length.   | string |

### \_links

| Name                           | Description                                | Schema         |
|--------------------------------|--|----------------|
| packageConte<br>nt<br>required | This type represents a link to a resource. | packageContent |
| <b>self</b> required           | This type represents a link to a resource. | self           |
| vnfd<br>optional               | This type represents a link to a resource. | vnfd           |

### packageContent

| Name                 | Description  | Schema       |
|----------------------|--|--------------|
| <b>href</b> required | URI of a resource referenced from a notification. Should be an absolute URI (i.e. a URI that contains {apiRoot}), however, may be a relative URI (i.e. a URI where the {apiRoot} part is omitted) if the {apiRoot} information is not available. | string (url) |

#### self

| Name                 | Description  | Schema       |
|----------------------|--|--------------|
| <b>href</b> required | URI of a resource referenced from a notification. Should be an absolute URI (i.e. a URI that contains {apiRoot}), however, may be a relative URI (i.e. a URI where the {apiRoot} part is omitted) if the {apiRoot} information is not available. | string (url) |

#### vnfd

| Name                 | Description  | Schema       |
|----------------------|--|--------------|
| <b>href</b> required | URI of a resource referenced from a notification. Should be an absolute URI (i.e. a URI that contains {apiRoot}), however, may be a relative URI (i.e. a URI where the {apiRoot} part is omitted) if the {apiRoot} information is not available. | string (url) |

#### additionalArtifacts

| Name                            | Description   | Schema   |
|---------------------------------|---|----------|
| <b>artifactPath</b><br>required | A string as defined in IETF RFC 8259.   | string   |
| checksum<br>required            | This type represents the checksum of a VNF package or an artifact file.   | checksum |
| metadata<br>optional            | This type represents a list of key-value pairs. The order of the pairs in the list is not significant. In JSON, a set of key-value pairs is represented as an object. It shall comply with the provisions defined in clause 4 of IETF RFC 7159. |          |

#### checksum

| Name                         | Description  | Schema |
|------------------------------|--|--------|
| <b>algorithm</b><br>required | Name of the algorithm used to generate the checksum, as defined in ETSI GS NFV-SOL 004 [5]. For example, SHA-256, SHA-512. | string |
| hash<br>required             | The hexadecimal value of the checksum.   | string |

#### checksum

| Name                         | Description  | Schema |
|------------------------------|--|--------|
| <b>algorithm</b><br>required | Name of the algorithm used to generate the checksum, as defined in ETSI GS NFV-SOL 004 [5]. For example, SHA-256, SHA-512. | string |
| hash<br>required             | The hexadecimal value of the checksum.   | string |

#### software Images

| Name                            | Description  | Schema   |
|---------------------------------|--|--|
| checksum<br>required            | This type represents the checksum of a VNF package or an artifact file.  | checksum   |
| containerFor<br>mat<br>required | Container format indicates whether the software image is in a file format that also contains meta-data about the actual software. Permitted values: - AKI: a kernel image format - AMI: a machine image format - ARI: a ram disk image format - BARE: the image does not have a container or meta-data envelope - DOCKER: docker container format - OVA: OVF package in a tar file - OVF: OVF container format   | ARI, BARE, DOCKER,   |
| diskFormat<br>required          | Disk format of a software image is the format of the underlying disk image. Permitted values: - AKI: a kernel image format - AMI: a machine image format - ARI: a ramdisk image format - ISO: an archive format for the data contents of an optical disc, such as CD-ROM - QCOW2: a common disk image format, which can expand dynamically and supports copy on write - RAW: an unstructured disk image format - VDI: a common disk image format - VHD: a common disk image format - VHDX: enhanced version of VHD format - VMDK: a common disk image format | enum (AKI, AMI,<br>ARI, ISO, QCOW2,<br>RAW, VDI, VHD,<br>VHDX, VMDK) |

| Name                     | Description   | Schema  |
|--------------------------|---|---------|
| <b>id</b><br>required    | Identifier of the VNF Virtual Link Descriptor (VLD) in the VNFD.  | string  |
| imagePath<br>required    | Path in the VNF package, which identifies the image artifact and also allows to access a copy of the image artifact.  | string  |
| minDisk<br>required      | The minimal disk for this software image in bytes.  Minimum value: 0  | integer |
| minRam<br>required       | The minimal RAM for this software image in bytes.  Minimum value: 0   | integer |
| name<br>required         | Name of the software image.   | string  |
| <b>provider</b> required | Provider of the software image.   | string  |
| size<br>required         | Size of this software image in bytes.  Minimum value: 0   | integer |
| userMetadata<br>optional | This type represents a list of key-value pairs. The order of the pairs in the list is not significant. In JSON, a set of key-value pairs is represented as an object. It shall comply with the provisions defined in clause 4 of IETF RFC 7159. | object  |
| version<br>required      | A Version. Representation: string of variable length.   | string  |

#### checksum

| Name                         | Description  | Schema |
|------------------------------|--|--------|
| <b>algorithm</b><br>required | Name of the algorithm used to generate the checksum, as defined in ETSI GS NFV-SOL 004 [5]. For example, SHA-256, SHA-512. | string |
| hash<br>required             | The hexadecimal value of the checksum.   | string |

| Name                      | Description   | Schema       |
|---------------------------|---|--------------|
| <b>detail</b><br>required | A human-readable explanation specific to this occurrence of the problem.  | string       |
| instance<br>optional      | A URI reference that identifies the specific occurrence of<br>the problem. It may yield further information if<br>dereferenced.   |              |
| <b>status</b><br>required | The HTTP status code for this occurrence of the problem. The HTTP status code ([RFC7231], Section 6) generated by the origin server for this occurrence of the problem.   | integer      |
| <b>title</b><br>optional  | A short, human-readable summary of the problem type. It should not change from occurrence to occurrence of the problem, except for purposes of localization. If type is given and other than "about:blank", this attribute shall also be provided. A short, human-readable summary of the problem type. It SHOULD NOT change from occurrence to occurrence of the problem, except for purposes of localization (e.g., using proactive content negotiation; see [RFC7231], Section 3.4). | string       |
| <b>type</b><br>optional   | A URI reference according to IETF RFC 3986 [5] that identifies the problem type. It is encouraged that the URI provides human-readable documentation for the problem (e.g. using HTML) when dereferenced. When this member is not present, its value is assumed to be "about:blank".  | string (URI) |

| Name                      | Description   | Schema  |
|---------------------------|---|---------|
| <b>detail</b><br>required | A human-readable explanation specific to this occurrence of the problem.  | string  |
| <b>instance</b> optional  | A URI reference that identifies the specific occurrence of<br>the problem. It may yield further information if<br>dereferenced.   |         |
| <b>status</b><br>required | The HTTP status code for this occurrence of the problem. The HTTP status code ([RFC7231], Section 6) generated by the origin server for this occurrence of the problem. | integer |

| Name                  | Description   | Schema       |
|-----------------------|---|--------------|
| <b>title</b> optional | A short, human-readable summary of the problem type. It should not change from occurrence to occurrence of the problem, except for purposes of localization. If type is given and other than "about:blank", this attribute shall also be provided. A short, human-readable summary of the problem type. It SHOULD NOT change from occurrence to occurrence of the problem, except for purposes of localization (e.g., using proactive content negotiation; see [RFC7231], Section 3.4). | string       |
| <b>type</b> optional  | A URI reference according to IETF RFC 3986 [5] that identifies the problem type. It is encouraged that the URI provides human-readable documentation for the problem (e.g. using HTML) when dereferenced. When this member is not present, its value is assumed to be "about:blank".  | string (URI) |

# Delete an individual VNF package.

DELETE /vnf\_packages/{vnfPkgId}

# **Description**

The DELETE method deletes an individual VNF Package resource.

#### **Parameters**

| Type   | Name                    | Description  | Schema |
|--------|-------------------------|--|--------|
| Header | Authorization optional  | The authorization token for the request. Reference: IETF RFC 7235.   | string |
| Header | <b>Version</b> required | Version of the API requested to use when responding to this request. | string |

| Type | Name                 | Description   | Schema |
|------|----------------------|---|--------|
| Path | vnfPkgId<br>required | Identifier of the VNF package. The identifier is allocated by the NFVO. | string |

| HTTP<br>Code | Description   | Schema     |
|--------------|---|------------|
| 204          | 204 No Content The VNF package has been deleted successfully. The response body shall be empty.  Headers:  Version (string): Version of the API used in the response. | No Content |

| HTTP<br>Code | Description  | Schema       |
|--------------|--|--------------|
| 400          | 400 BAD REQUEST 400 code can be returned in the following specified cases, the specific cause has to be proper specified in the "ProblemDetails" structure to be returned. If the request is malformed or syntactically incorrect (e.g. if the request URI contains incorrect query parameters or the payload body contains a syntactically incorrect data structure), the API producer shall respond with this response code. The "ProblemDetails" structure shall be provided, and should include in the "detail" attribute more information about the source of the problem. If the response to a GET request which queries a container resource would be so big that the performance of the API producer is adversely affected, and the API producer does not support paging for the affected resource, it shall respond with this response code. The "ProblemDetails" structure shall be provided, and should include in the "detail" attribute more information about the source of the problem. If there is an application error related to the client's input that cannot be easily mapped to any other HTTP response code ("catch all error"), the API producer shall respond with this response code. The "ProblemDetails" structure shall be provided, and shall include in the "detail" attribute more information about the source of the problem. If the request contains a malformed access token, the API producer should respond with this response. The details of the error shall be returned in the WWW Authenticate HTTP header, as defined in IETF RFC 6750 and IETF RFC 7235. The ProblemDetails structure may be provided. The use of this HTTP error response code described above is applicable to the use of the OAuth 2.0 for the authorization of API requests and notifications, as defined in clauses 4.5.3.3 and 4.5.3.4.  Headers:  Content-Type (string): The MIME type of the body of the response.  WWW-Authenticate (string): Challenge if the corresponding HTTP request has not provided authorization, or error details if the corresponding HTTP request has provided an invalid auth | Response 400 |

| HTTP<br>Code | Description  | Schema       |
|--------------|--|--------------|
| 401          | 401 UNAUTHORIZED If the request contains no access token even though one is required, or if the request contains an authorization token that is invalid (e.g. expired or revoked), the API producer should respond with this response. The details of the error shall be returned in the WWW-Authenticate HTTP header, as defined in IETF RFC 6750 and IETF RFC 7235. The ProblemDetails structure may be provided.  Headers:  Content-Type (string): The MIME type of the body of the response.  WWW-Authenticate (string): Challenge if the corresponding HTTP request has not provided authorization, or error details if the corresponding HTTP request has provided an invalid authorization token.  Version (string): Version of the API used in the response. | Response 401 |
| 403          | 403 FORBIDDEN If the API consumer is not allowed to perform a particular request to a particular resource, the API producer shall respond with this response code. The "ProblemDetails" structure shall be provided. It should include in the "detail" attribute information about the source of the problem, and may indicate how to solve it.  Headers:  Content-Type (string): The MIME type of the body of the response.  WWW-Authenticate (string): Challenge if the corresponding HTTP request has not provided authorization, or error details if the corresponding HTTP request has provided an invalid authorization token.  Version (string): Version of the API used in the response.   | Response 403 |

| HTTP<br>Code | Description   | Schema       |
|--------------|---|--------------|
| 404          | 404 NOT FOUND If the API producer did not find a current representation for the resource addressed by the URI passed in the request or is not willing to disclose that one exists, it shall respond with this response code. The "ProblemDetails" structure may be provided, including in the "detail" attribute information about the source of the problem, e.g. a wrong resource URI variable. This response code is not appropriate in case the resource addressed by the URI is a container resource which is designed to contain child resources, but does not contain any child resource at the time the request is received. For a GET request to an existing empty container resource, a typical response contains a 200 OK response code and a payload body with an empty array.  Headers:  Content-Type (string): The MIME type of the body of the response.  WWW-Authenticate (string): Challenge if the corresponding HTTP request has not provided authorization, or error details if the corresponding HTTP request has provided an invalid authorization token.  Version (string): Version of the API used in the response. |              |
| 405          | 405 METHOD NOT ALLOWED If a particular HTTP method is not supported for a particular resource, the API producer shall respond with this response code. The "ProblemDetails" structure may be omitted.  Headers: Content-Type (string): The MIME type of the body of the response.  WWW-Authenticate (string): Challenge if the corresponding HTTP request has not provided authorization, or error details if the corresponding HTTP request has provided an invalid authorization token.  Version (string): Version of the API used in the response.   | Response 405 |
| 406          | 406 NOT ACCEPTABLE If the "Accept" header does not contain at least one name of a content type that is acceptable to the API producer, the API producer shall respond with this response code. The "ProblemDetails" structure may be omitted.  Headers: Content-Type (string): The MIME type of the body of the response.  WWW-Authenticate (string): Challenge if the corresponding HTTP request has not provided authorization, or error details if the corresponding HTTP request has provided an invalid authorization token.  Version (string): Version of the API used in the response.   | Response 406 |

| HTTP<br>Code | Description   | Schema       |
|--------------|---|--------------|
| 409          | 409 CONFLICT  Headers: Content-Type (string): The MIME type of the body of the response.  WWW-Authenticate (string): Challenge if the corresponding HTTP request has not provided authorization, or error details if the corresponding HTTP request has provided an invalid authorization token.  Version (string): Version of the API used in the response.  | Response 409 |
| 416          | 416 RANGE NOT SATISFIABLE  Headers: Content-Type (string): The MIME type of the body of the response.  WWW-Authenticate (string): Challenge if the corresponding HTTP request has not provided authorization, or error details if the corresponding HTTP request has provided an invalid authorization token.  Version (string): Version of the API used in the response.   | Response 416 |
| 500          | 500 INTERNAL SERVER ERROR If there is an application error not related to the client's input that cannot be easily mapped to any other HTTP response code ("catch all error"), the API producer shall respond with this response code. The "ProblemDetails" structure shall be provided, and shall include in the "detail" attribute more information about the source of the problem.  Headers:  Content-Type (string): The MIME type of the body of the response.  WWW-Authenticate (string): Challenge if the corresponding HTTP request has not provided authorization, or error details if the corresponding HTTP request has provided an invalid authorization token.  Version (string): Version of the API used in the response. | Response 500 |

| HTTP<br>Code | Description  | Schema       |
|--------------|--|--------------|
| 503          | 503 SERVICE UNAVAILABLE If the API producer encounters an internal overload situation of itself or of a system it relies on, it should respond with this response code, following the provisions in IETF RFC 7231 for the use of the "Retry-After" HTTP header and for the alternative to refuse the connection. The "ProblemDetails" structure may be omitted.  Headers:  Content-Type (string): The MIME type of the body of the response.  WWW-Authenticate (string): Challenge if the corresponding HTTP request has not provided authorization, or error details if the corresponding HTTP request has provided an invalid authorization token.  Version (string): Version of the API used in the response. | Response 503 |

| Name                        | Description   | Schema  |

| instance<br>optional     | A URI reference that identifies the specific occurrence of<br>the problem. It may yield further information if<br>dereferenced.   |              |
| status<br>required       | The HTTP status code for this occurrence of the problem. The HTTP status code ([RFC7231], Section 6) generated by the origin server for this occurrence of the problem.   | integer      |
| <b>title</b><br>optional | A short, human-readable summary of the problem type. It should not change from occurrence to occurrence of the problem, except for purposes of localization. If type is given and other than "about:blank", this attribute shall also be provided. A short, human-readable summary of the problem type. It SHOULD NOT change from occurrence to occurrence of the problem, except for purposes of localization (e.g., using proactive content negotiation; see [RFC7231], Section 3.4). |              |
| <b>type</b><br>optional  | A URI reference according to IETF RFC 3986 [5] that identifies the problem type. It is encouraged that the URI provides human-readable documentation for the problem (e.g. using HTML) when dereferenced. When this member is not present, its value is assumed to be "about:blank".  | string (URI) |

# Update information about an individual VNF package.

PATCH /vnf\_packages/{vnfPkgId}

## **Description**

"The PATCH method updates the information of a VNF package." "This method shall follow the provisions specified in the Tables 9.4.3.3.4-1 and 9.4.3.3.4-2 for URI query parameters, request and response data structures, and response codes."

#### **Parameters**

| Type   | Name                   | Description  | Schema |
|--------|------------------------|--|--------|
| Header | Authorization optional | The authorization token for the request. Reference: IETF RFC 7235. | string |
| Header | Content-Type required  | The MIME type of the body of the request. Reference: IETF RFC 7231 | string |

| Туре   | Name                    | Description   | Schema |
|--------|-------------------------|---|--------|
| Header | <b>Version</b> required | Version of the API requested to use when responding to this request.    | string |
| Path   | vnfPkgId<br>required    | Identifier of the VNF package. The identifier is allocated by the NFVO. | string |
| Body   | <b>body</b><br>required | Parameters for VNF package information modifications.                   | body   |

### body

| Name                             | Description  | Schema                      |
|----------------------------------|--|-----------------------------|
| operationalSt<br>ate<br>optional | "The enumeration PackageOperationalStateType shall comply with the provisions defined in Table 9.5.4.4-1." Acceptable values are: - ENABLED - The VNF package is enabled, i.e. it can be used for instantiation of new VNF instances DISABLED - The VNF package is disabled, i.e. it cannot be used for further VNF instantiation requests (unless and until the VNF package is re-enabled). | enum (ENABLED,<br>DISABLED) |
| userDefinedD<br>ata<br>optional  | This type represents a list of key-value pairs. The order of the pairs in the list is not significant. In JSON, a set of key-value pairs is represented as an object. It shall comply with the provisions defined in clause 4 of IETF RFC 7159.  |                             |

| HTTP<br>Code | Description   | Schema       |
|--------------|---|--------------|
| 200          | 200 OK Shall be returned when the operation has been completed successfully. The response body shall contain attribute modifications for an "Individual VNF package" resource.  Headers:  Content-Type (string): The MIME type of the body of the response.  WWW-Authenticate (string): Challenge if the corresponding HTTP request has not provided authorization, or error details if the corresponding HTTP request has provided an invalid authorization token.  Version (string): Version of the API used in the response. | Response 200 |

| HTTP<br>Code | Description  | Schema       |
|--------------|--|--------------|
| 400          | 400 BAD REQUEST 400 code can be returned in the following specified cases, the specific cause has to be proper specified in the "ProblemDetails" structure to be returned. If the request is malformed or syntactically incorrect (e.g. if the request URI contains incorrect query parameters or the payload body contains a syntactically incorrect data structure), the API producer shall respond with this response code. The "ProblemDetails" structure shall be provided, and should include in the "detail" attribute more information about the source of the problem. If the response to a GET request which queries a container resource would be so big that the performance of the API producer is adversely affected, and the API producer does not support paging for the affected resource, it shall respond with this response code. The "ProblemDetails" structure shall be provided, and should include in the "detail" attribute more information about the source of the problem. If there is an application error related to the client's input that cannot be easily mapped to any other HTTP response code ("catch all error"), the API producer shall respond with this response code. The "ProblemDetails" structure shall be provided, and shall include in the "detail" attribute more information about the source of the problem. If the request contains a malformed access token, the API producer should respond with this response. The details of the error shall be returned in the WWW Authenticate HTTP header, as defined in IETF RFC 6750 and IETF RFC 7235. The ProblemDetails structure may be provided. The use of this HTTP error response code described above is applicable to the use of the OAuth 2.0 for the authorization of API requests and notifications, as defined in clauses 4.5.3.3 and 4.5.3.4.  Headers:  Content-Type (string): The MIME type of the body of the response.  WWW-Authenticate (string): Challenge if the corresponding HTTP request has not provided authorization, or error details if the corresponding HTTP request has provided an invalid auth | Response 400 |

| HTTP<br>Code | Description  | Schema       |
|--------------|--|--------------|
| 401          | 401 UNAUTHORIZED If the request contains no access token even though one is required, or if the request contains an authorization token that is invalid (e.g. expired or revoked), the API producer should respond with this response. The details of the error shall be returned in the WWW-Authenticate HTTP header, as defined in IETF RFC 6750 and IETF RFC 7235. The ProblemDetails structure may be provided.  Headers:  Content-Type (string): The MIME type of the body of the response.  WWW-Authenticate (string): Challenge if the corresponding HTTP request has not provided authorization, or error details if the corresponding HTTP request has provided an invalid authorization token.  Version (string): Version of the API used in the response. | Response 401 |
| 403          | 403 FORBIDDEN If the API consumer is not allowed to perform a particular request to a particular resource, the API producer shall respond with this response code. The "ProblemDetails" structure shall be provided. It should include in the "detail" attribute information about the source of the problem, and may indicate how to solve it.  Headers:  Content-Type (string): The MIME type of the body of the response.  WWW-Authenticate (string): Challenge if the corresponding HTTP request has not provided authorization, or error details if the corresponding HTTP request has provided an invalid authorization token.  Version (string): Version of the API used in the response.   | Response 403 |

| HTTP<br>Code | Description   | Schema       |
|--------------|---|--------------|
| 404          | 404 NOT FOUND If the API producer did not find a current representation for the resource addressed by the URI passed in the request or is not willing to disclose that one exists, it shall respond with this response code. The "ProblemDetails" structure may be provided, including in the "detail" attribute information about the source of the problem, e.g. a wrong resource URI variable. This response code is not appropriate in case the resource addressed by the URI is a container resource which is designed to contain child resources, but does not contain any child resource at the time the request is received. For a GET request to an existing empty container resource, a typical response contains a 200 OK response code and a payload body with an empty array.  Headers:  Content-Type (string): The MIME type of the body of the response.  WWW-Authenticate (string): Challenge if the corresponding HTTP request has not provided authorization, or error details if the corresponding HTTP request has provided an invalid authorization token.  Version (string): Version of the API used in the response. | Response 404 |
| 405          | 405 METHOD NOT ALLOWED If a particular HTTP method is not supported for a particular resource, the API producer shall respond with this response code. The "ProblemDetails" structure may be omitted.  Headers: Content-Type (string): The MIME type of the body of the response.  WWW-Authenticate (string): Challenge if the corresponding HTTP request has not provided authorization, or error details if the corresponding HTTP request has provided an invalid authorization token.  Version (string): Version of the API used in the response.   | Response 405 |
| 406          | 406 NOT ACCEPTABLE If the "Accept" header does not contain at least one name of a content type that is acceptable to the API producer, the API producer shall respond with this response code. The "ProblemDetails" structure may be omitted.  Headers:  Content-Type (string): The MIME type of the body of the response.  WWW-Authenticate (string): Challenge if the corresponding HTTP request has not provided authorization, or error details if the corresponding HTTP request has provided an invalid authorization token.  Version (string): Version of the API used in the response.  | Response 406 |

| HTTP<br>Code | Description   | Schema       |
|--------------|---|--------------|
| 409          | 409 CONFLICT  Headers: Content-Type (string): The MIME type of the body of the response.  WWW-Authenticate (string): Challenge if the corresponding HTTP request has not provided authorization, or error details if the corresponding HTTP request has provided an invalid authorization token.  Version (string): Version of the API used in the response.  | Response 409 |
| 416          | 416 RANGE NOT SATISFIABLE  Headers: Content-Type (string): The MIME type of the body of the response.  WWW-Authenticate (string): Challenge if the corresponding HTTP request has not provided authorization, or error details if the corresponding HTTP request has provided an invalid authorization token.  Version (string): Version of the API used in the response.   | Response 416 |
| 500          | 500 INTERNAL SERVER ERROR If there is an application error not related to the client's input that cannot be easily mapped to any other HTTP response code ("catch all error"), the API producer shall respond with this response code. The "ProblemDetails" structure shall be provided, and shall include in the "detail" attribute more information about the source of the problem.  Headers:  Content-Type (string): The MIME type of the body of the response.  WWW-Authenticate (string): Challenge if the corresponding HTTP request has not provided authorization, or error details if the corresponding HTTP request has provided an invalid authorization token.  Version (string): Version of the API used in the response. | Response 500 |

| HTTP<br>Code | Description  | Schema       |
|--------------|--|--------------|
| 503          | 503 SERVICE UNAVAILABLE If the API producer encounters an internal overload situation of itself or of a system it relies on, it should respond with this response code, following the provisions in IETF RFC 7231 for the use of the "Retry-After" HTTP header and for the alternative to refuse the connection. The "ProblemDetails" structure may be omitted.  Headers:  Content-Type (string): The MIME type of the body of the response.  WWW-Authenticate (string): Challenge if the corresponding HTTP request has not provided authorization, or error details if the corresponding HTTP request has provided an invalid authorization token.  Version (string): Version of the API used in the response. | Response 503 |

# Fetch individual VNF package artifact.

GET /vnf\_packages/{vnfPkgId}/artifacts/{artifactPath}

## **Description**

The GET method fetches the content of an artifact within a VNF package. This method shall follow the provisions specified in the Tables 9.4.7.3.2-1 and 9.4.7.3.2-2 for URI query parameters, request and response data structures, and response codes.

#### **Parameters**

| Туре   | Name                   | Description   | Schema |
|--------|------------------------|---|--------|
| Header | Accept<br>required     | Content-Types that are acceptable for the response.   | string |
| Header | Authorization optional | The authorization token for the request. Reference: IETF RFC 7235.  | string |
| Header | Range<br>optional      | The request may contain a "Range" HTTP header to obtain single range of bytes from the VNF package file. This can be used to continue an aborted transmission. If the NFVO does not support range requests, it should return the whole file with a 200 OK response instead. | string |

| Type   | Name                            | Description   | Schema |
|--------|---------------------------------|---|--------|
| Header | <b>Version</b> required         | Version of the API requested to use when responding to this request.  | string |
| Path   | <b>artifactPath</b><br>required | Sequence of one or path segments representing the path of the artifact within the VNF package, relative to the root of the package. This identifier can be retrieved from the "artifactPath" attribute of the applicable "additionalArtifacts" entry in the body of the response to a GET request querying the "Individual VNF package" or the "VNF packages" resource. | string |
| Path   | vnfPkgId<br>required            | Identifier of the on-boarded VNF package. The identifier is allocated by the NFVO. This identifier can be retrieved from the "vnfPkgId" attribute in the VnfPackageOnboardingNotification or VnfPackageChangeNotification.  | string |

| HTTP<br>Code | Description   | Schema     |
|--------------|---|------------|
| 200          | 200 OK Shall be returned when the whole content of the artifact file has been read successfully. The payload body shall contain a copy of the artifact file from the VNF package, as defined by ETSI GS NFV-SOL 004. The "Content-Type" HTTP header shall be set according to the content type of the artifact file. If the content type cannot be determined, the header shall be set to the value "application/octet-stream.  Headers:  Content-Type (string): The MIME type of the body of the response.  WWW-Authenticate (string): Challenge if the corresponding HTTP request has not provided authorization, or error details if the corresponding HTTP request has provided an invalid authorization token.  Version (string): Version of the API used in the response. | No Content |

| HTTP<br>Code | Description   | Schema |
|--------------|---|--------|
| 206          | Partial Content. If the NFVO supports range requests, this response shall be returned when a single consecutive byte range from the content of the artifact file has been read successfully according to the request. The response body shall contain the requested part of the artifact file from the VNF package, as defined by ETSI GS NFV-SOL 004. The "Content-Type" HTTP header shall be set according to the content type of the artifact file. If the content type cannot be determined, the header shall be set to the value "application/octetstream". The "Content-Range" HTTP header shall be provided according to IETF RFC 7233.  Headers: Content-Range (string) Content-Type (string): The MIME type of the body of the response.  WWW-Authenticate (string): Challenge if the corresponding HTTP request has not provided authorization, or error details if the corresponding HTTP request has provided an invalid authorization token. |        |

| HTTP<br>Code | Description  | Schema       |
|--------------|--|--------------|
| 400          | 400 BAD REQUEST 400 code can be returned in the following specified cases, the specific cause has to be proper specified in the "ProblemDetails" structure to be returned. If the request is malformed or syntactically incorrect (e.g. if the request URI contains incorrect query parameters or the payload body contains a syntactically incorrect data structure), the API producer shall respond with this response code. The "ProblemDetails" structure shall be provided, and should include in the "detail" attribute more information about the source of the problem. If the response to a GET request which queries a container resource would be so big that the performance of the API producer is adversely affected, and the API producer does not support paging for the affected resource, it shall respond with this response code. The "ProblemDetails" structure shall be provided, and should include in the "detail" attribute more information about the source of the problem. If there is an application error related to the client's input that cannot be easily mapped to any other HTTP response code ("catch all error"), the API producer shall respond with this response code. The "ProblemDetails" structure shall be provided, and shall include in the "detail" attribute more information about the source of the problem. If the request contains a malformed access token, the API producer should respond with this response. The details of the error shall be returned in the WWW Authenticate HTTP header, as defined in IETF RFC 6750 and IETF RFC 7235. The ProblemDetails structure may be provided. The use of this HTTP error response code described above is applicable to the use of the OAuth 2.0 for the authorization of API requests and notifications, as defined in clauses 4.5.3.3 and 4.5.3.4.  Headers:  Content-Type (string): The MIME type of the body of the response.  WWI-Authenticate (string): Challenge if the corresponding HTTP request has not provided authorization, or error details if the corresponding HTTP request has provided an invalid auth | Response 400 |

| HTTP<br>Code | Description  | Schema       |
|--------------|--|--------------|
| 401          | 401 UNAUTHORIZED If the request contains no access token even though one is required, or if the request contains an authorization token that is invalid (e.g. expired or revoked), the API producer should respond with this response. The details of the error shall be returned in the WWW-Authenticate HTTP header, as defined in IETF RFC 6750 and IETF RFC 7235. The ProblemDetails structure may be provided.  Headers:  Content-Type (string): The MIME type of the body of the response.  WWW-Authenticate (string): Challenge if the corresponding HTTP request has not provided authorization, or error details if the corresponding HTTP request has provided an invalid authorization token.  Version (string): Version of the API used in the response. | Response 401 |
| 403          | 403 FORBIDDEN If the API consumer is not allowed to perform a particular request to a particular resource, the API producer shall respond with this response code. The "ProblemDetails" structure shall be provided. It should include in the "detail" attribute information about the source of the problem, and may indicate how to solve it.  Headers:  Content-Type (string): The MIME type of the body of the response.  WWW-Authenticate (string): Challenge if the corresponding HTTP request has not provided authorization, or error details if the corresponding HTTP request has provided an invalid authorization token.  Version (string): Version of the API used in the response.   | Response 403 |

| HTTP<br>Code | Description   | Schema       |
|--------------|---|--------------|
| 404          | 404 NOT FOUND If the API producer did not find a current representation for the resource addressed by the URI passed in the request or is not willing to disclose that one exists, it shall respond with this response code. The "ProblemDetails" structure may be provided, including in the "detail" attribute information about the source of the problem, e.g. a wrong resource URI variable. This response code is not appropriate in case the resource addressed by the URI is a container resource which is designed to contain child resources, but does not contain any child resource at the time the request is received. For a GET request to an existing empty container resource, a typical response contains a 200 OK response code and a payload body with an empty array.  Headers:  Content-Type (string): The MIME type of the body of the response.  WWW-Authenticate (string): Challenge if the corresponding HTTP request has not provided authorization, or error details if the corresponding HTTP request has provided an invalid authorization token.  Version (string): Version of the API used in the response. |              |
| 405          | 405 METHOD NOT ALLOWED If a particular HTTP method is not supported for a particular resource, the API producer shall respond with this response code. The "ProblemDetails" structure may be omitted.  Headers: Content-Type (string): The MIME type of the body of the response.  WWW-Authenticate (string): Challenge if the corresponding HTTP request has not provided authorization, or error details if the corresponding HTTP request has provided an invalid authorization token.  Version (string): Version of the API used in the response.   | Response 405 |
| 406          | 406 NOT ACCEPTABLE If the "Accept" header does not contain at least one name of a content type that is acceptable to the API producer, the API producer shall respond with this response code. The "ProblemDetails" structure may be omitted.  Headers: Content-Type (string): The MIME type of the body of the response.  WWW-Authenticate (string): Challenge if the corresponding HTTP request has not provided authorization, or error details if the corresponding HTTP request has provided an invalid authorization token.  Version (string): Version of the API used in the response.   | Response 406 |

| HTTP<br>Code | Description   | Schema       |
|--------------|---|--------------|
| 409          | 409 CONFLICT  Headers: Content-Type (string): The MIME type of the body of the response.  WWW-Authenticate (string): Challenge if the corresponding HTTP request has not provided authorization, or error details if the corresponding HTTP request has provided an invalid authorization token.  Version (string): Version of the API used in the response.  | Response 409 |
| 416          | 416 RANGE NOT SATISFIABLE  Headers: Content-Type (string): The MIME type of the body of the response.  WWW-Authenticate (string): Challenge if the corresponding HTTP request has not provided authorization, or error details if the corresponding HTTP request has provided an invalid authorization token.  Version (string): Version of the API used in the response.   | Response 416 |
| 500          | 500 INTERNAL SERVER ERROR If there is an application error not related to the client's input that cannot be easily mapped to any other HTTP response code ("catch all error"), the API producer shall respond with this response code. The "ProblemDetails" structure shall be provided, and shall include in the "detail" attribute more information about the source of the problem.  Headers:  Content-Type (string): The MIME type of the body of the response.  WWW-Authenticate (string): Challenge if the corresponding HTTP request has not provided authorization, or error details if the corresponding HTTP request has provided an invalid authorization token.  Version (string): Version of the API used in the response. | Response 500 |

| HTTP<br>Code | Description  | Schema       |
|--------------|--|--------------|
| 503          | 503 SERVICE UNAVAILABLE If the API producer encounters an internal overload situation of itself or of a system it relies on, it should respond with this response code, following the provisions in IETF RFC 7231 for the use of the "Retry-After" HTTP header and for the alternative to refuse the connection. The "ProblemDetails" structure may be omitted.  Headers:  Content-Type (string): The MIME type of the body of the response.  WWW-Authenticate (string): Challenge if the corresponding HTTP request has not provided authorization, or error details if the corresponding HTTP request has provided an invalid authorization token.  Version (string): Version of the API used in the response. | Response 503 |

| Name                      | Description   | Schema       |
|---------------------------|---|--------------|
| <b>detail</b><br>required | A human-readable explanation specific to this occurrence of the problem.  | string       |
| <b>instance</b> optional  | A URI reference that identifies the specific occurrence of<br>the problem. It may yield further information if<br>dereferenced.   |              |
| <b>status</b><br>required | The HTTP status code for this occurrence of the problem. The HTTP status code ([RFC7231], Section 6) generated by the origin server for this occurrence of the problem.   | integer      |
| <b>title</b><br>optional  | A short, human-readable summary of the problem type. It should not change from occurrence to occurrence of the problem, except for purposes of localization. # Fetch an on-boarded VNF package.

GET /vnf\_packages/{vnfPkgId}/package\_content

# **Description**

The GET method fetches the content of a VNF package identified by the VNF package identifier allocated by the NFVO. This method shall follow the provisions specified in the Tables 9.4.5.3.2-1 and 9.4.5.3.2-2 for URI query parameters, request and response data structures, and response codes.

#### **Parameters**

| Type   | Name                   | Description  | Schema                    |
|--------|------------------------|--|---------------------------|
| Header | <b>Accept</b> required | Content-Types that are acceptable for the response.                | enum<br>(application/zip) |
| Header | Authorization optional | The authorization token for the request. Reference: IETF RFC 7235. | string                    |

| Туре   | Name                    | Description   | Schema |
|--------|-------------------------|---|--------|
| Header | Range<br>optional       | The request may contain a "Range" HTTP header to obtain single range of bytes from the VNF package file. This can be used to continue an aborted transmission. If the NFVO does not support range requests, it should return the whole file with a 200 OK response instead. |        |
| Header | <b>Version</b> required | Version of the API requested to use when responding to this request.  | string |
| Path   | vnfPkgId<br>required    | Identifier of the on-boarded VNF package. The identifier is allocated by the NFVO.  | string |

| HTTP<br>Code | Description  | Schema       |
|--------------|--|--------------|
| 200          | 200 OK Shall be returned when the whole content of the VNF package file has been read successfully. The response body shall include a copy of the VNF package file. The "Content-Type" HTTP header shall be set according to the type of the file, i.e. to "application/zip" for a VNF Package as defined in ETSI GS NFV-SOL 004.  Headers:  Content-Type (string): The MIME type of the body of the response.  WWW-Authenticate (string): Challenge if the corresponding HTTP request has not provided authorization, or error details if the corresponding HTTP request has provided an invalid authorization token.  Version (string): Version of the API used in the response. | No Content   |
| 206          | 206 PARTIAL CONTENT  Headers: Content-Type (string): The MIME type of the body of the response. Content-Range (string): The Content-Range response HTTP header indicates where in a full body message a partial message belongs.  WWW-Authenticate (string): Challenge if the corresponding HTTP request has not provided authorization, or error details if the corresponding HTTP request has provided an invalid authorization token.  Version (string): Version of the API used in the response.   | Response 206 |

| HTTP<br>Code | Description  | Schema       |
|--------------|--|--------------|
| 400          | 400 BAD REQUEST 400 code can be returned in the following specified cases, the specific cause has to be proper specified in the "ProblemDetails" structure to be returned. If the request is malformed or syntactically incorrect (e.g. if the request URI contains incorrect query parameters or the payload body contains a syntactically incorrect data structure), the API producer shall respond with this response code. The "ProblemDetails" structure shall be provided, and should include in the "detail" attribute more information about the source of the problem. If the response to a GET request which queries a container resource would be so big that the performance of the API producer is adversely affected, and the API producer does not support paging for the affected resource, it shall respond with this response code. The "ProblemDetails" structure shall be provided, and should include in the "detail" attribute more information about the source of the problem. If there is an application error related to the client's input that cannot be easily mapped to any other HTTP response code ("catch all error"), the API producer shall respond with this response code. The "ProblemDetails" structure shall be provided, and shall include in the "detail" attribute more information about the source of the problem. If the request contains a malformed access token, the API producer should respond with this response. The details of the error shall be returned in the WWW Authenticate HTTP header, as defined in IETF RFC 6750 and IETF RFC 7235. The ProblemDetails structure may be provided. The use of this HTTP error response code described above is applicable to the use of the OAuth 2.0 for the authorization of API requests and notifications, as defined in clauses 4.5.3.3 and 4.5.3.4.  Headers:  Content-Type (string): The MIME type of the body of the response.  WWW-Authenticate (string): Challenge if the corresponding HTTP request has not provided authorization, or error details if the corresponding HTTP request has provided an invalid auth | Response 400 |

| HTTP<br>Code | Description  | Schema       |
|--------------|--|--------------|
| 401          | 401 UNAUTHORIZED If the request contains no access token even though one is required, or if the request contains an authorization token that is invalid (e.g. expired or revoked), the API producer should respond with this response. The details of the error shall be returned in the WWW-Authenticate HTTP header, as defined in IETF RFC 6750 and IETF RFC 7235. The ProblemDetails structure may be provided.  Headers:  Content-Type (string): The MIME type of the body of the response.  WWW-Authenticate (string): Challenge if the corresponding HTTP request has not provided authorization, or error details if the corresponding HTTP request has provided an invalid authorization token.  Version (string): Version of the API used in the response. | Response 401 |
| 403          | 403 FORBIDDEN If the API consumer is not allowed to perform a particular request to a particular resource, the API producer shall respond with this response code. The "ProblemDetails" structure shall be provided. It should include in the "detail" attribute information about the source of the problem, and may indicate how to solve it.  Headers:  Content-Type (string): The MIME type of the body of the response.  WWW-Authenticate (string): Challenge if the corresponding HTTP request has not provided authorization, or error details if the corresponding HTTP request has provided an invalid authorization token.  Version (string): Version of the API used in the response.   | Response 403 |

| HTTP<br>Code | Description   | Schema       |
|--------------|---|--------------|
| 404          | 404 NOT FOUND If the API producer did not find a current representation for the resource addressed by the URI passed in the request or is not willing to disclose that one exists, it shall respond with this response code. The "ProblemDetails" structure may be provided, including in the "detail" attribute information about the source of the problem, e.g. a wrong resource URI variable. This response code is not appropriate in case the resource addressed by the URI is a container resource which is designed to contain child resources, but does not contain any child resource at the time the request is received. For a GET request to an existing empty container resource, a typical response contains a 200 OK response code and a payload body with an empty array.  Headers:  Content-Type (string): The MIME type of the body of the response.  WWW-Authenticate (string): Challenge if the corresponding HTTP request has not provided authorization, or error details if the corresponding HTTP request has provided an invalid authorization token.  Version (string): Version of the API used in the response. |              |
| 405          | 405 METHOD NOT ALLOWED If a particular HTTP method is not supported for a particular resource, the API producer shall respond with this response code. The "ProblemDetails" structure may be omitted.  Headers: Content-Type (string): The MIME type of the body of the response.  WWW-Authenticate (string): Challenge if the corresponding HTTP request has not provided authorization, or error details if the corresponding HTTP request has provided an invalid authorization token.  Version (string): Version of the API used in the response.   | Response 405 |
| 406          | 406 NOT ACCEPTABLE If the "Accept" header does not contain at least one name of a content type that is acceptable to the API producer, the API producer shall respond with this response code. The "ProblemDetails" structure may be omitted.  Headers:  Content-Type (string): The MIME type of the body of the response.  WWW-Authenticate (string): Challenge if the corresponding HTTP request has not provided authorization, or error details if the corresponding HTTP request has provided an invalid authorization token.  Version (string): Version of the API used in the response.  | Response 406 |

| HTTP<br>Code | Description   | Schema       |
|--------------|---|--------------|
| 409          | 409 CONFLICT  Headers: Content-Type (string): The MIME type of the body of the response.  WWW-Authenticate (string): Challenge if the corresponding HTTP request has not provided authorization, or error details if the corresponding HTTP request has provided an invalid authorization token.  Version (string): Version of the API used in the response.  | Response 409 |
| 416          | 416 RANGE NOT SATISFIABLE  Headers: Content-Type (string): The MIME type of the body of the response.  WWW-Authenticate (string): Challenge if the corresponding HTTP request has not provided authorization, or error details if the corresponding HTTP request has provided an invalid authorization token.  Version (string): Version of the API used in the response.   | Response 416 |
| 500          | 500 INTERNAL SERVER ERROR If there is an application error not related to the client's input that cannot be easily mapped to any other HTTP response code ("catch all error"), the API producer shall respond with this response code. The "ProblemDetails" structure shall be provided, and shall include in the "detail" attribute more information about the source of the problem.  Headers:  Content-Type (string): The MIME type of the body of the response.  WWW-Authenticate (string): Challenge if the corresponding HTTP request has not provided authorization, or error details if the corresponding HTTP request has provided an invalid authorization token.  Version (string): Version of the API used in the response. | Response 500 |

| HTTP<br>Code | Description  | Schema       |
|--------------|--|--------------|
| 503          | 503 SERVICE UNAVAILABLE If the API producer encounters an internal overload situation of itself or of a system it relies on, it should respond with this response code, following the provisions in IETF RFC 7231 for the use of the "Retry-After" HTTP header and for the alternative to refuse the connection. The "ProblemDetails" structure may be omitted.  Headers:  Content-Type (string): The MIME type of the body of the response.  WWW-Authenticate (string): Challenge if the corresponding HTTP request has not provided authorization, or error details if the corresponding HTTP request has provided an invalid authorization token.  Version (string): Version of the API used in the response. | Response 503 |

# Upload a VNF package by providing the content of the VNF package.

PUT /vnf\_packages/{vnfPkgId}/package\_content

## **Description**

The PUT method uploads the content of a VNF package. This method shall follow the provisions specified in the Tables 9.4.5.3.3-1 and 9.4.5.3.3-2 for URI query parameters, request and response data structures, and response codes.

#### **Parameters**

| Type   | Name                          | Description  | Schema                    |
|--------|-------------------------------|--|---------------------------|
| Header | <b>Accept</b> required        | Content-Types that are acceptable for the response.                                | enum<br>(application/zip) |
| Header | <b>Authorization</b> optional | The authorization token for the request. Reference: IETF RFC 7235.                 | string                    |
| Header | <b>Version</b> required       | Version of the API requested to use when responding to this request.               | string                    |
| Path   | vnfPkgId<br>required          | Identifier of the on-boarded VNF package. The identifier is allocated by the NFVO. | string                    |

| Type         | Name             | Description   | Schema |
|--------------|------------------|---|--------|
| FormDat<br>a | file<br>optional | The payload body contains a ZIP file that represents the VNF package. The "Content-Type" HTTP header shall be set according to the type of the file, i.e. to "application/zip" for a VNF Package as defined in ETSI GS NFV-SOL 004. |        |

| HTTP<br>Code | Description   | Schema |
|--------------|---|--------|
| 202          | 202 Accepted The VNF package has been accepted for uploading, but the processing has not been completed. It is expected to take some time for processing. The response body shall be empty. The client can track the uploading progress by receiving the "VnfPackageOnBoardingNotification" from the NFVO or by reading the status of the individual VNF package resource using the GET method.  Headers:  Version (string): Version of the API used in the response. |        |

| HTTP<br>Code | Description   | Schema       |
|--------------|---|--------------|
| 400          | 400 BAD REQUEST 400 code can be returned in the following specified cases, the specific cause has to be proper specified in the "ProblemDetails" structure to be returned. If the request is malformed or syntactically incorrect (e.g. if the request URI contains incorrect query parameters or the payload body contains a syntactically incorrect data structure), the API producer shall respond with this response code. The "ProblemDetails" structure shall be provided, and should include in the "detail" attribute more information about the source of the problem. If the response to a GET request which queries a container resource would be so big that the performance of the API producer is adversely affected, and the API producer does not support paging for the affected resource, it shall respond with this response code. The "ProblemDetails" structure shall be provided, and should include in the "detail" attribute more information about the source of the problem. If there is an application error related to the client's input that cannot be easily mapped to any other HTTP response code ("catch all error"), the API producer shall respond with this response code. The "ProblemDetails" structure shall be provided, and shall include in the "detail" attribute more information about the source of the problem. If the request contains a malformed access token, the API producer should respond with this response. The details of the error shall be returned in the WWW Authenticate HTTP header, as defined in IETF RFC 6750 and IETF RFC 7235. The ProblemDetails structure may be provided. The use of the OAuth 2.0 for the authorization of API requests and notifications, as defined in clauses 4.5.3.3 and 4.5.3.4.  Headers:  Content-Type (string): The MIME type of the body of the response.  WWW-Authenticate (string): Challenge if the corresponding HTTP request has not provided authorization, or error details if the corresponding HTTP request has provided authorization invalid authorization token. | Response 400 |

| HTTP<br>Code | Description  | Schema       |
|--------------|--|--------------|
| 401          | 401 UNAUTHORIZED If the request contains no access token even though one is required, or if the request contains an authorization token that is invalid (e.g. expired or revoked), the API producer should respond with this response. The details of the error shall be returned in the WWW-Authenticate HTTP header, as defined in IETF RFC 6750 and IETF RFC 7235. The ProblemDetails structure may be provided.  Headers:  Content-Type (string): The MIME type of the body of the response.  WWW-Authenticate (string): Challenge if the corresponding HTTP request has not provided authorization, or error details if the corresponding HTTP request has provided an invalid authorization token.  Version (string): Version of the API used in the response. | Response 401 |
| 403          | 403 FORBIDDEN If the API consumer is not allowed to perform a particular request to a particular resource, the API producer shall respond with this response code. The "ProblemDetails" structure shall be provided. It should include in the "detail" attribute information about the source of the problem, and may indicate how to solve it.  Headers:  Content-Type (string): The MIME type of the body of the response.  WWW-Authenticate (string): Challenge if the corresponding HTTP request has not provided authorization, or error details if the corresponding HTTP request has provided an invalid authorization token.  Version (string): Version of the API used in the response.   | Response 403 |

| HTTP<br>Code | Description   | Schema       |
|--------------|---|--------------|
| 404          | 404 NOT FOUND If the API producer did not find a current representation for the resource addressed by the URI passed in the request or is not willing to disclose that one exists, it shall respond with this response code. The "ProblemDetails" structure may be provided, including in the "detail" attribute information about the source of the problem, e.g. a wrong resource URI variable. This response code is not appropriate in case the resource addressed by the URI is a container resource which is designed to contain child resources, but does not contain any child resource at the time the request is received. For a GET request to an existing empty container resource, a typical response contains a 200 OK response code and a payload body with an empty array.  Headers:  Content-Type (string): The MIME type of the body of the response.  WWW-Authenticate (string): Challenge if the corresponding HTTP request has not provided authorization, or error details if the corresponding HTTP request has provided an invalid authorization token.  Version (string): Version of the API used in the response. | Response 404 |
| 405          | 405 METHOD NOT ALLOWED If a particular HTTP method is not supported for a particular resource, the API producer shall respond with this response code. The "ProblemDetails" structure may be omitted.  Headers: Content-Type (string): The MIME type of the body of the response.  WWW-Authenticate (string): Challenge if the corresponding HTTP request has not provided authorization, or error details if the corresponding HTTP request has provided an invalid authorization token.  Version (string): Version of the API used in the response.   | Response 405 |
| 406          | 406 NOT ACCEPTABLE If the "Accept" header does not contain at least one name of a content type that is acceptable to the API producer, the API producer shall respond with this response code. The "ProblemDetails" structure may be omitted.  Headers:  Content-Type (string): The MIME type of the body of the response.  WWW-Authenticate (string): Challenge if the corresponding HTTP request has not provided authorization, or error details if the corresponding HTTP request has provided an invalid authorization token.  Version (string): Version of the API used in the response.  | Response 406 |

| HTTP<br>Code | Description   | Schema       |
|--------------|---|--------------|
| 409          | 409 CONFLICT  Headers: Content-Type (string): The MIME type of the body of the response.  WWW-Authenticate (string): Challenge if the corresponding HTTP request has not provided authorization, or error details if the corresponding HTTP request has provided an invalid authorization token.  Version (string): Version of the API used in the response.  | Response 409 |
| 500          | 500 INTERNAL SERVER ERROR If there is an application error not related to the client's input that cannot be easily mapped to any other HTTP response code ("catch all error"), the API producer shall respond with this response code. The "ProblemDetails" structure shall be provided, and shall include in the "detail" attribute more information about the source of the problem.  Headers:  Content-Type (string): The MIME type of the body of the response.  WWW-Authenticate (string): Challenge if the corresponding HTTP request has not provided authorization, or error details if the corresponding HTTP request has provided an invalid authorization token.  Version (string): Version of the API used in the response. | Response 500 |
| 503          | 503 SERVICE UNAVAILABLE If the API producer encounters an internal overload situation of itself or of a system it relies on, it should respond with this response code, following the provisions in IETF RFC 7231 for the use of the "Retry-After" HTTP header and for the alternative to refuse the connection. The "ProblemDetails" structure may be omitted.  Headers:  Content-Type (string): The MIME type of the body of the response.  WWW-Authenticate (string): Challenge if the corresponding HTTP request has not provided authorization, or error details if the corresponding HTTP request has provided an invalid authorization token.  Version (string): Version of the API used in the response.                        | Response 503 |

#### **Consumes**

• multipart/form-data

# Upload a VNF package by providing the address information of the VNF package.

POST /vnf\_packages/{vnfPkgId}/package\_content/upload\_from\_uri

#### **Description**

The POST method provides the information for the NFVO to get the content of a VNF package. This method shall follow the provisions specified in the Tables 9.4.6.3.1-1 and 9.4.6.3.1-2 for URI query parameters, request and response data structures, and response codes.

#### **Parameters**

| Туре   | Name                    | Description  | Schema |
|--------|-------------------------|--|--------|
| Header | Accept<br>required      | Content-Types that are acceptable for the response. Reference: IETF RFC 7231   | string |
| Header | Authorization optional  | The authorization token for the request.<br>Reference: IETF RFC 7235   | string |
| Header | <b>Version</b> required | Version of the API requested to use when responding to this request.   | string |
| Path   | vnfPkgId<br>required    | Identifier of the VNF package. The identifier is allocated by the NFVO.  | string |
| Body   | <b>body</b><br>required | The payload body contains the address information based on which the NFVO can obtain the content of the VNF package. | body   |

## body

| Name                            | Description   | Schema |
|---------------------------------|---|--------|
| userDefinedD<br>ata<br>optional | This type represents a list of key-value pairs. The order of the pairs in the list is not significant. In JSON, a set of key-value pairs is represented as an object. It shall comply with the provisions defined in clause 4 of IETF RFC 7159. | ahiaat |

| HTTP<br>Code | Description   | Schema |
|--------------|---|--------|
| 202          | 202 Accepted The information about the VNF package has been received successfully, but the on-boarding has not been completed. It is expected to take some time for processing. The response body shall be empty.  Headers:  Version (string): Version of the API used in the response. |        |

| HTTP<br>Code | Description  | Schema       |
|--------------|--|--------------|
| 400          | 400 BAD REQUEST 400 code can be returned in the following specified cases, the specific cause has to be proper specified in the "ProblemDetails" structure to be returned. If the request is malformed or syntactically incorrect (e.g. if the request URI contains incorrect query parameters or the payload body contains a syntactically incorrect data structure), the API producer shall respond with this response code. The "ProblemDetails" structure shall be provided, and should include in the "detail" attribute more information about the source of the problem. If the response to a GET request which queries a container resource would be so big that the performance of the API producer is adversely affected, and the API producer does not support paging for the affected resource, it shall respond with this response code. The "ProblemDetails" structure shall be provided, and should include in the "detail" attribute more information about the source of the problem. If there is an application error related to the client's input that cannot be easily mapped to any other HTTP response code ("catch all error"), the API producer shall respond with this response code. The "ProblemDetails" structure shall be provided, and shall include in the "detail" attribute more information about the source of the problem. If the request contains a malformed access token, the API producer should respond with this response. The details of the error shall be returned in the WWW Authenticate HTTP header, as defined in IETF RFC 6750 and IETF RFC 7235. The ProblemDetails structure may be provided. The use of this HTTP error response code described above is applicable to the use of the OAuth 2.0 for the authorization of API requests and notifications, as defined in clauses 4.5.3.3 and 4.5.3.4.  Headers:  Content-Type (string): The MIME type of the body of the response.  WWW-Authenticate (string): Challenge if the corresponding HTTP request has not provided authorization, or error details if the corresponding HTTP request has provided an invalid auth | Response 400 |

| HTTP<br>Code | Description  | Schema       |
|--------------|--|--------------|
| 401          | 401 UNAUTHORIZED If the request contains no access token even though one is required, or if the request contains an authorization token that is invalid (e.g. expired or revoked), the API producer should respond with this response. The details of the error shall be returned in the WWW-Authenticate HTTP header, as defined in IETF RFC 6750 and IETF RFC 7235. The ProblemDetails structure may be provided.  Headers:  Content-Type (string): The MIME type of the body of the response.  WWW-Authenticate (string): Challenge if the corresponding HTTP request has not provided authorization, or error details if the corresponding HTTP request has provided an invalid authorization token.  Version (string): Version of the API used in the response. | Response 401 |
| 403          | 403 FORBIDDEN If the API consumer is not allowed to perform a particular request to a particular resource, the API producer shall respond with this response code. The "ProblemDetails" structure shall be provided. It should include in the "detail" attribute information about the source of the problem, and may indicate how to solve it.  Headers:  Content-Type (string): The MIME type of the body of the response.  WWW-Authenticate (string): Challenge if the corresponding HTTP request has not provided authorization, or error details if the corresponding HTTP request has provided an invalid authorization token.  Version (string): Version of the API used in the response.   | Response 403 |

| HTTP<br>Code | Description   | Schema       |
|--------------|---|--------------|
| 404          | 404 NOT FOUND If the API producer did not find a current representation for the resource addressed by the URI passed in the request or is not willing to disclose that one exists, it shall respond with this response code. The "ProblemDetails" structure may be provided, including in the "detail" attribute information about the source of the problem, e.g. a wrong resource URI variable. This response code is not appropriate in case the resource addressed by the URI is a container resource which is designed to contain child resources, but does not contain any child resource at the time the request is received. For a GET request to an existing empty container resource, a typical response contains a 200 OK response code and a payload body with an empty array.  Headers:  Content-Type (string): The MIME type of the body of the response.  WWW-Authenticate (string): Challenge if the corresponding HTTP request has not provided authorization, or error details if the corresponding HTTP request has provided an invalid authorization token.  Version (string): Version of the API used in the response. |              |
| 405          | 405 METHOD NOT ALLOWED If a particular HTTP method is not supported for a particular resource, the API producer shall respond with this response code. The "ProblemDetails" structure may be omitted.  Headers: Content-Type (string): The MIME type of the body of the response.  WWW-Authenticate (string): Challenge if the corresponding HTTP request has not provided authorization, or error details if the corresponding HTTP request has provided an invalid authorization token.  Version (string): Version of the API used in the response.   | Response 405 |
| 406          | 406 NOT ACCEPTABLE If the "Accept" header does not contain at least one name of a content type that is acceptable to the API producer, the API producer shall respond with this response code. The "ProblemDetails" structure may be omitted.  Headers:  Content-Type (string): The MIME type of the body of the response.  WWW-Authenticate (string): Challenge if the corresponding HTTP request has not provided authorization, or error details if the corresponding HTTP request has provided an invalid authorization token. # Read VNFD of an on-boarded VNF package.

GET /vnf\_packages/{vnfPkgId}/vnfd

#### **Description**

The GET method reads the content of the VNFD within a VNF package. The VNFD can be implemented as a single file or as a collection of multiple files. If the VNFD is implemented in the form of multiple files, a ZIP file embedding these files shall be returned. If the VNFD is implemented as a single file, either that file or a ZIP file embedding that file shall be returned. The selection of the format is controlled by the "Accept" HTTP header passed in the GET request. • If the "Accept" header contains only "text/plain" and the VNFD is implemented as a single file, the file shall be returned; otherwise, an error message shall be returned. • If the "Accept" header contains only "application/zip", the single file or the multiple files that make up the VNFD shall be returned embedded in a ZIP file. • If the "Accept" header contains both "text/plain" and "application/zip", it is up to the NFVO to choose the format to return for a single-file VNFD; for a multi-file VNFD, a ZIP file shall be returned. The default format of the ZIP file shall be the one specified in ETSI GS NFV-SOL 004 [5] where only the YAML files representing the VNFD, and information necessary to navigate the ZIP file and to identify the file that is the entry point for parsing the VNFD (such as TOSCA-meta

or manifest files or naming conventions) are included. This method shall follow the provisions specified in the Tables 9.4.4.3.2-1 and 9.4.4.3.2-2 for URI query parameters, request and response data structures, and response codes.

#### **Parameters**

| Туре   | Name                    | Description  | Schema                             |
|--------|-------------------------|--|------------------------------------|
| Header | Accept<br>required      | Content-Types that are acceptable for the response.                                | enum (text/plain, application/zip) |
| Header | Authorization optional  | The authorization token for the request. Reference: IETF RFC 7235.                 | string                             |
| Header | <b>Version</b> required | Version of the API requested to use when responding to this request.               | string                             |
| Path   | vnfPkgId<br>required    | Identifier of the on-boarded VNF package. The identifier is allocated by the NFVO. | string                             |

| HTTP<br>Code | Description   | Schema     |
|--------------|---|------------|
| 200          | 200 OK Shall be returned when the content of the VNFD has been read successfully. The payload body shall contain a copy of the file representing the VNFD or a ZIP file that contains the file or multiple files representing the VNFD, as specified above. The "Content-Type" HTTP header shall be set according to the format of the returned file, i.e. to "text/plain" for a YAML file or to "application/zip" for a ZIP file.  Headers:  Content-Type (string): The MIME type of the body of the response.  WWW-Authenticate (string): Challenge if the corresponding HTTP request has not provided authorization, or error details if the corresponding HTTP request has provided an invalid authorization token.  Version (string): Version of the API used in the response. | No Content |

| HTTP<br>Code | Description  | Schema       |
|--------------|--|--------------|
| 400          | 400 BAD REQUEST 400 code can be returned in the following specified cases, the specific cause has to be proper specified in the "ProblemDetails" structure to be returned. If the request is malformed or syntactically incorrect (e.g. if the request URI contains incorrect query parameters or the payload body contains a syntactically incorrect data structure), the API producer shall respond with this response code. The "ProblemDetails" structure shall be provided, and should include in the "detail" attribute more information about the source of the problem. If the response to a GET request which queries a container resource would be so big that the performance of the API producer is adversely affected, and the API producer does not support paging for the affected resource, it shall respond with this response code. The "ProblemDetails" structure shall be provided, and should include in the "detail" attribute more information about the source of the problem. If there is an application error related to the client's input that cannot be easily mapped to any other HTTP response code ("catch all error"), the API producer shall respond with this response code. The "ProblemDetails" structure shall be provided, and shall include in the "detail" attribute more information about the source of the problem. If the request contains a malformed access token, the API producer should respond with this response. The details of the error shall be returned in the WWW Authenticate HTTP header, as defined in IETF RFC 6750 and IETF RFC 7235. The ProblemDetails structure may be provided. The use of the OAuth 2.0 for the authorization of API requests and notifications, as defined in clauses 4.5.3.3 and 4.5.3.4.  Headers:  Content-Type (string): The MIME type of the body of the response.  WWW-Authenticate (string): Challenge if the corresponding HTTP request has not provided authorization, or error details if the corresponding HTTP request has provided an invalid authorization token.  Version (string): Version of the API used in the respons | Response 400 |

| HTTP<br>Code | Description  | Schema       |
|--------------|--|--------------|
| 401          | 401 UNAUTHORIZED If the request contains no access token even though one is required, or if the request contains an authorization token that is invalid (e.g. expired or revoked), the API producer should respond with this response. The details of the error shall be returned in the WWW-Authenticate HTTP header, as defined in IETF RFC 6750 and IETF RFC 7235. The ProblemDetails structure may be provided.  Headers:  Content-Type (string): The MIME type of the body of the response.  WWW-Authenticate (string): Challenge if the corresponding HTTP request has not provided authorization, or error details if the corresponding HTTP request has provided an invalid authorization token.  Version (string): Version of the API used in the response. | Response 401 |
| 403          | 403 FORBIDDEN If the API consumer is not allowed to perform a particular request to a particular resource, the API producer shall respond with this response code. The "ProblemDetails" structure shall be provided. It should include in the "detail" attribute information about the source of the problem, and may indicate how to solve it.  Headers:  Content-Type (string): The MIME type of the body of the response.  WWW-Authenticate (string): Challenge if the corresponding HTTP request has not provided authorization, or error details if the corresponding HTTP request has provided an invalid authorization token.  Version (string): Version of the API used in the response.   | Response 403 |

| HTTP<br>Code | Description   | Schema       |
|--------------|---|--------------|
| 404          | 404 NOT FOUND If the API producer did not find a current representation for the resource addressed by the URI passed in the request or is not willing to disclose that one exists, it shall respond with this response code. The "ProblemDetails" structure may be provided, including in the "detail" attribute information about the source of the problem, e.g. a wrong resource URI variable. This response code is not appropriate in case the resource addressed by the URI is a container resource which is designed to contain child resources, but does not contain any child resource at the time the request is received. For a GET request to an existing empty container resource, a typical response contains a 200 OK response code and a payload body with an empty array.  Headers:  Content-Type (string): The MIME type of the body of the response.  WWW-Authenticate (string): Challenge if the corresponding HTTP request has not provided authorization, or error details if the corresponding HTTP request has provided an invalid authorization token.  Version (string): Version of the API used in the response. |              |
| 405          | 405 METHOD NOT ALLOWED If a particular HTTP method is not supported for a particular resource, the API producer shall respond with this response code. The "ProblemDetails" structure may be omitted.  Headers: Content-Type (string): The MIME type of the body of the response.  WWW-Authenticate (string): Challenge if the corresponding HTTP request has not provided authorization, or error details if the corresponding HTTP request has provided an invalid authorization token.  Version (string): Version of the API used in the response.   | Response 405 |
| 406          | 406 NOT ACCEPTABLE If the "Accept" header does not contain at least one name of a content type that is acceptable to the API producer, the API producer shall respond with this response code. The "ProblemDetails" structure may be omitted.  Headers:  Content-Type (string): The MIME type of the body of the response.  WWW-Authenticate (string): Challenge if the corresponding HTTP request has not provided authorization, or error details if the corresponding HTTP request has provided an invalid authorization token.  Version (string): Version of the API used in the response.  | Response 406 |

| HTTP<br>Code | Description   | Schema       |
|--------------|---|--------------|
| 409          | 409 CONFLICT  Headers: Content-Type (string): The MIME type of the body of the response.  WWW-Authenticate (string): Challenge if the corresponding HTTP request has not provided authorization, or error details if the corresponding HTTP request has provided an invalid authorization token.  Version (string): Version of the API used in the response.  | Response 409 |
| 416          | 416 RANGE NOT SATISFIABLE  Headers: Content-Type (string): The MIME type of the body of the response.  WWW-Authenticate (string): Challenge if the corresponding HTTP request has not provided authorization, or error details if the corresponding HTTP request has provided an invalid authorization token.  Version (string): Version of the API used in the response.   | Response 416 |
| 500          | 500 INTERNAL SERVER ERROR If there is an application error not related to the client's input that cannot be easily mapped to any other HTTP response code ("catch all error"), the API producer shall respond with this response code. The "ProblemDetails" structure shall be provided, and shall include in the "detail" attribute more information about the source of the problem.  Headers:  Content-Type (string): The MIME type of the body of the response.  WWW-Authenticate (string): Challenge if the corresponding HTTP request has not provided authorization, or error details if the corresponding HTTP request has provided an invalid authorization token.  Version (string): Version of the API used in the response. | Response 500 |

| HTTP<br>Code | Description  | Schema       |
|--------------|--|--------------|
| 503          | 503 SERVICE UNAVAILABLE If the API producer encounters an internal overload situation of itself or of a system it relies on, it should respond with this response code, following the provisions in IETF RFC 7231 for the use of the "Retry-After" HTTP header and for the alternative to refuse the connection. The "ProblemDetails" structure may be omitted.  Headers:  Content-Type (string): The MIME type of the body of the response.  WWW-Authenticate (string): Challenge if the corresponding HTTP request has not provided authorization, or error details if the corresponding HTTP request has provided an invalid authorization token.  Version (string): Version of the API used in the response. | Response 503 |

| Name                        | Description   | Schema       |
|-----------------------------|---|--------------|
| <b>detail</b> required      | A human-readable explanation specific to this occurrence of the problem.  | string       |
| <b>instance</b><br>optional | A URI reference that identifies the specific occurrence of<br>the problem. It may yield further information if<br>dereferenced.   |              |
| <b>status</b><br>required   | The HTTP status code for this occurrence of the problem. The HTTP status code ([RFC7231], Section 6) generated by the origin server for this occurrence of the problem.   | integer      |
| <b>title</b><br>optional    | A short, human-readable summary of the problem type. It should not change from occurrence to occurrence of the problem, except for purposes of localization. If type is given and other than "about:blank", this attribute shall also be provided. A short, human-readable summary of the problem type. It SHOULD NOT change from occurrence to occurrence of the problem, except for purposes of localization (e.g., using proactive content negotiation; see [RFC7231], Section 3.4). | string       |
| <b>type</b> optional        | A URI reference according to IETF RFC 3986 [5] that identifies the problem type. It is encouraged that the URI provides human-readable documentation for the problem (e.g. using HTML) when dereferenced. When this member is not present, its value is assumed to be "about:blank".  | string (URI) |

| Name | Description  | Schema |
|------|--|--------|
|      | A human-readable explanation specific to this occurrence of the problem. | string |
